Title: The Demographic Change and Economic Features: The Nexus with Internet Use

Journal: Heliyon

Dear Wilson,

Thank you for submitting your manuscript to Heliyon. We have completed the review of your manuscript and a summary is appended below. The reviewers recommend major revisions are required before publication can be considered.If you are able to address all reviewer comments in full, I invite you to resubmit your manuscript. We ask that you respond to each reviewer comment by either

outlining how the criticism was addressed in the revised manuscript or by providing a rebuttal to the criticism.

This should be carried out in a point-by-point fashion as illustrated here:

<https://www.cell.com/heliyon/guide-for-authors#Revisions>.

To allow the editors and reviewers to easily assess your revised manuscript, we also ask that you upload a version of your manuscript highlighting any revisions made. You may wish to use Microsoft Word's Track Changes tool or, for LaTeX files, the latexdiff Perl script (<https://ctan.org/pkg/latexdiff>). To submit your revised manuscript, please log in as an author at <https://www.editorialmanager.com/heliyon/>, and navigate to the "Submissions Needing Revision" folder.

Your revision due date is May 24, 2022. We understand that the COVID-19 pandemic may well be causing disruption for you and your colleagues. If that is the case for you and it has an impact on your ability to make revisions to address the concerns that came up in the review process, please reach out to us. I look forward to receiving your revised manuscript.

Kind regards,

Romanus Osabohien

Associate Editor - Business & Economics

Heliyon

Editor and Reviewer comments:

**Reviewer 3: Methods:**

Author did not discuss the countries of study and their regions rationale for selecting them need to be explained

**Reviewer 1 asked, "Are you use the test on series of log return series or original series? Clarify?"**

Author did not understand this question, therefore did not give appropriate response.

The question is, Did you use the original data as it is or you transformed the data using natural log?

Reviewer 1 commented that, "The paper lacks a clear justification of the variables used in the empirical section and should include updated/recent literature

Author did not understand this question, therefore did not give appropriate response,

The question is, why did you decided to use variables like; information technology, typology of pre-, early- (EarlyDD), late- (LateDD), and postdemographic dividend (PostDD) with pre-demographic dividend typology as the reference category. The economic variables, access to electricity, gross domestic product, inflation, consumer prices and foreign direct investment net inflows.

Results:

Interpretation:

Up till now the conclusion is not well written. Authors(s) should follow this format for conclusion writing.

(i) brief background, (ii) key findings, (iii) their implications, and (iii) suggestions/recommendation

Other comments:

One of the reviewer comment is:

(1) The introductory section is meant to introduce the study, the gap and set pace for the remaining sections.

(2) This section has failed to link the three key variables, demographic change, economic features and internet usage.

Author(s) did not introduce any gap or set pace for the remaining section,

To introduce gap in a research work, author(s) need to start with a sentence like this, "A summary of the reviewed literature revealed that no study on .... had been carried out using ..... in order to address the gap indicated above this study sought to determine the ... "

To set pace for the remaining section, author(s) should provide a statement like this, "the remainder of the paper is organized as follows. In section 2.0, Data and Method was presented, section three provided the ... e.t.c.

Almost all the reviewers requested for the significance or motivation of this study. This can only be stated if the gaps in existing literature can be clearly highlighted.

**Reviewer 4:** Methods: The conceptualization and operationalization of this study are problematic. This study has shown a low degree of novelty. No clear problem statement nor research gap is highlighted. No details of data collection.

Results: Therefore, I am not convinced by the findings.

Interpretation: The interpretation of the findings is rather weak and not rigorous.

**Other comments: Need to highlight the theoretical and practical of this study**

**Reviewer 5:** Methods: The method used is descriptive method using documentary analysis. However, the documents analyzed did not cover countries included in the sample respondents. The analysis of findings would have been more comprehensive and exciting to readers if name of countries were included in the findings.

Results: The results of the study is comprehensive, however if there is labelling of countries included in the variables it would have more exciting.

Interpretation: The interpretation based from statistical analysis of the document is comprehensive.

Other comments: Labelling countries in the demographic typology is recommended.

Reviewer 6: Methods:

Results:

Interpretation:

Other comments:

**Reviewer 8:** Methods: The methods employed by the author(s) are suitable. However, there is need to first specify the implicit function of the model before the explicit function. In addition, the specified model is not correctly specified without the subscript 'it'. It looks more like a time series model.

Results: The results are adequately explained. Although there is a need for theoretical framework to link all parts of the study.

Interpretation: The explanation still lacks theoretical basis.

Other comments: The issues raised by the author(s) are important and adequately addressed, but poor grammatical expressions alter the correct discussion of findings in the study. I hereby suggest a thorough editing by an expert in English language writing to edit the manuscript before publication.

**Reviewer 9: Methods:**

The process of subject selection was clear.

The variables were defined and measured appropriately.

The study methods were valid and reliable.

There is enough detail to replicate the study.

Results:

The text in the results added to the data.

A statistically significant result was clear.

A practically meaningful result was clear.

Interpretation:

was clear

Other comments:

**Reviewer 10: Methods:** clear enough; it needs more appropriate reasoning in choosing GMM estimator

Results: clear enough

Interpretation: Still using the old references for justifying the findings

Other comments:

\*\*\*\*\*

Data in Brief (optional):

We invite you to convert your supplementary data (or a part of it) into an additional journal publication in Data in Brief, a multi-disciplinary open access journal. Data in Brief articles are a fantastic way to

describe supplementary data and associated metadata, or full raw datasets deposited in an external repository, which are otherwise unnoticed. A Data in Brief article (which will be reviewed, formatted, indexed, and given a DOI) will make your data easier to find, reproduce, and cite.

You can submit to Data in Brief when you upload your revised manuscript. To do so, complete the template and follow the co-submission instructions found here: [www.elsevier.com/dib-template](http://www.elsevier.com/dib-template). If your manuscript is accepted, your Data in Brief submission will automatically be transferred to Data in Brief for editorial review and publication.

Please note: an open access Article Publication Charge (APC) is payable by the author or research funder to cover the costs associated with publication in Data in Brief and ensure your data article is immediately and permanently free to access by all. For the current APC see: [www.elsevier.com/journals/data-in-brief/2352-3409/open-access-journal](http://www.elsevier.com/journals/data-in-brief/2352-3409/open-access-journal)

Please contact the Data in Brief editorial office at [dib-me@elsevier.com](mailto:dib-me@elsevier.com) or visit the Data in Brief homepage ([www.journals.elsevier.com/data-in-brief/](http://www.journals.elsevier.com/data-in-brief/)) if you have questions or need further information.

#### IV. Decision

Dear Dr. Rajagukguk,

Thank you for submitting your manuscript to Heliyon.

We have now received all of the editor and reviewer comments on your recent submission to Heliyon. Your paper will become acceptable for publication after implementation of minor formatting and/or administrative changes outlined below. To avoid unnecessary delays in the publication of your manuscript, please do not make any other additional changes during this revision.

Please reference all numbered tables in text. Currently, table [6] in the manuscript have not been cited in text.

To submit your revised manuscript, please log in as an author at <https://www.editorialmanager.com/heliyon/>, and navigate to the "Submissions Needing Revision" folder under the Author Main Menu. When submitting your revised manuscript, please ensure that you upload your most recent document with the "Revised manuscript file - highlighting revisions made" item type.

Kind regards,

Yating Zhang  
Editorial Section Manager  
Heliyon

Embargo  
Embargos are not automatically set for papers published in Heliyon. Papers appear online a few days after acceptance. To request a media embargo and/or publication on a specific date to assist an institutional press release, please reach out to the Heliyon team ([info@heliyon.com](mailto:info@heliyon.com)) as soon as possible and we will do our best to accommodate your request.

Heliyon is an online publication and we do not impose a limit on the length of the article or the number of figures. If you have supplementary content you would prefer not to combine with your main manuscript file please ensure all your supplementary files are self-contained and can stand alone (title, legend, etc.) that all labels and names within the supplementary content are unique to

Editor and Reviewer Comments

Reviewer's Responses to Questions

Notes: In order to effectively convey your recommendations for improvement to the author(s), and help editors make well-informed and efficient decisions, we ask you to answer the following specific questions about the manuscript and provide additional suggestions where appropriate. Are the objectives and the rationale of the study clearly stated? Please provide suggestions to the author(s) on how to improve the clarity of the objectives and rationale of the study. Please number each suggestion so that author(s) can more easily respond.

Reviewer #6: Yes

Reviewer #8: The objectives are now clearly stated.

Reviewer #9: yes, clearly stated.

-----

2. If applicable, is the application/theory/method/study reported in sufficient detail to allow for its replicability and/or reproducibility? Please provide suggestions to the author(s) on how to improve the replicability/reproducibility of their study. Please number each suggestion so that the author(s) can more easily respond.

Title: The Demographic and Economic Features: The Nexus with Internet Use

Journal: Heliyon

Dear Dr. Rajagukguk,

Thank you for submitting your manuscript to Heliyon.

I am pleased to inform you that your manuscript has been accepted for publication.

Your accepted manuscript will now be transferred to our production department. We will create a proof which you will be asked to check, and you will also be asked to complete a number of online forms required for publication. If we need additional information from you during the production process, we will contact you directly.

We appreciate and value your contribution to Heliyon. We regularly invite authors of recently published manuscript to participate in the peer review process. If you were not already part of the journal's reviewer pool, you have now been added to it. We look forward to your continued participation in our journal, and we hope you will consider us again for future submissions.

Kind regards,  
Yating Zhang

## The Demographic and Economic Features: The Nexus with Internet Use

--Manuscript Draft--

<b>Manuscript Number:</b>	HELIYON-D-21-11053R2
<b>Article Type:</b>	Original Research Article
<b>Keywords:</b>	Demographic dividend type; economic determinants; internet use; fixed effects
<b>Manuscript Classifications:</b>	140: Social Sciences
<b>Corresponding Author:</b>	Wilson Rajagukguk, Ph.D. Universitas Kristen Indonesia Jakarta Timur, Jakarta INDONESIA
<b>First Author:</b>	Wilson Rajagukguk, Ph.D.
<b>Order of Authors:</b>	Wilson Rajagukguk, Ph.D.
<b>Abstract:</b>	<p>The goal of this study was to examine the nexus between demographic dividend type and economic features with internet use. The data source was from the World Development Indicator of the World Bank. The unit analysis was country. The panel data analysis method was used for the examination, employing fixed effects regression models using country income level, country regional group, and year as identifiers. The random effects regression model, pooled least square model, and static generalized method of moments were utilized for robustness checks. The dependent variable was the percentage of population using the internet. The independent variables consisted of demographic and economic variables. The demographic variable was the demographic dividend type, while the economic variables were access to electricity, GDP, inflation rate, and foreign direct investment. The results of fixed effects regression indicate that after controlling for the economic features, higher internet use in a country was associated with late- and post-demographic dividend type. Higher internet use was also associated with higher access to electricity, higher GDP, lower inflation rate, and higher foreign direct investment inflow. Robustness checks using random-effects and pooled least square models, using fixed-effects model by country income level, using two-stage least square, and using second stage regression by G20 and non-G20 country group division and year, similarly gave consistent results. The association of internet use with the demographic and economic features may imply that population-based and economic development program should be enhanced toward the favorable ones that increase internet usage among the population.</p>

Title: The Demographic Change and Economic Features: The Nexus with Internet Use

Journal: Heliyon

Dear Wilson,

Thank you for submitting your manuscript to Heliyon. We have completed the review of your manuscript and a summary is appended below. The reviewers recommend major revisions are required before publication can be considered. If you are able to address all reviewer comments in full, I invite you to resubmit your manuscript. We ask that you respond to each reviewer comment by either outlining how the criticism was addressed in the revised manuscript or by providing a rebuttal to the criticism.

This should be carried out in a point-by-point fashion as illustrated here: <https://www.cell.com/heliyon/guide-for-authors#Revisions>.

To allow the editors and reviewers to easily assess your revised manuscript, we also ask that you upload a version of your manuscript highlighting any revisions made. You may wish to use Microsoft Word's Track Changes tool or, for LaTeX files, the latexdiff Perl script (<https://ctan.org/pkg/latexdiff>). To submit your revised manuscript, please log in as an author at <https://www.editorialmanager.com/heliyon/>, and navigate to the "Submissions Needing Revision" folder.

Your revision due date is May 24, 2022. We understand that the COVID-19 pandemic may well be causing disruption for you and your colleagues. If that is the case for you and it has an impact on your

ability to make revisions to address the concerns that came up in the review process, please reach out to us. I look forward to receiving your revised manuscript.

Kind regards,

Romanus Osabohien

Associate Editor - Business & Economics

Heliyon

Editor and Reviewer comments:

Reviewer 3: Methods:

Author did not discuss the countries of study and their regions rationale for selecting them need to be explained.

Author: Thank you very much for the comments. A table of list of countries of the study has been added in Appendix Table A. The discussion about the countries also has been added in line 329–334.

Reviewer 1 asked, "Are you use the test on series of log return series or original series? Clarify?"

Author did not understand this question, therefore did not give appropriate response.

The question is, Did you use the original data as it is or you transformed the data using natural log?

Author: Thank you very much for the comments. The Author used the original data for all variables, except for GDP where natural log was used as explained in the models in line 282–283 and 297–303.

Reviewer 1 commented that, "The paper lacks a clear justification of the variables used in the empirical section and should include updated/recent literature.

Author: Thank you very much for the comments.

As stated in Section 1 (Introduction) that there was a significant inequality in access to the internet across countries in the world.

The Author was interested to study the factors of this inequality in the internet use with a hope that it will contribute to the understanding of the determinants of internet use as well as to improve access to the internet use as a part of sustainable development goals (SDGs).

Author did not understand this question, therefore did not give appropriate response,

The question is, why did you decided to use variables like; information technology, typology of pre-, early- (EarlyDD), late- (LateDD), and postdemographic dividend (PostDD) with pre-demographic dividend typology as the reference category. The economic variables, access to electricity, gross domestic product, inflation, consumer prices and foreign direct investment net inflows.

Author: Thank you very much for the comments.

The Author chose the demographic and economic features as the independent variables. Demographic dividend type was selected as demographic feature, while access to electricity, GDP, inflation, and FDI as economic features. The types of demographic dividend were based

on Ahmed et al. (2016) in line 89–103 and the availability of the data from the World Bank.

Study on the role of demographic change on development, including access to information and communication technology was limited. Therefore, the Author chose this variable as the independent variable. The selection of electricity, GDP, inflation, and FDI as economic features was based on the literature review and availability of data.

Results:

Interpretation:

Up till now the conclusion is not well written. Authors(s) should follow this format for conclusion writing.

(i) brief background, (ii) key findings, (iii) their implications, and (iii) suggestions/recommendation

Author: Thank you very much for the comments. The Conclusion has been revised as in line 506–533.

Other comments:

One of the reviewer comment is:

(1) The introductory section is meant to introduce the study, the gap and set pace for the remaining sections.

Author: Thank you very much for the comments. The gap and pace for remaining sections have been added, respectively in line 115–118 and 127–129.

(2) This section has failed to link the three key variables, demographic change, economic features and internet usage.

Author: Thank you very much for the comments. This study focused on (1) the association between demographic change and internet and (2) the association between economic features and internet. The links of these variables have been added in line 79 – 87.

Author(s) did not introduce any gap or set pace for the remaining section,

To introduce gap in a research work, author(s) need to start with a sentence like this, "A summary of the reviewed literature revealed that no study on .... had been carried out using ..... in order to address the gap indicated above this study sought to determine the ... "

To set pace for the remaining section, author(s) should provide a statement like this, "the remainder of the paper is organized as follows. In section 2.0, Data and Method was presented, section three provided the ... e.t.c.

Author: Thank you very much for the suggestions. The gap and pace for remaining sections have been added, respectively, in line 115–118 and 127–129.

Almost all the reviewers requested for the significance or motivation of this study. This can only be stated if the gaps in existing literature can be clearly highlighted.

Author: Thank you very much for the suggestions. The gap has been added in line 127–129.

Reviewer 4: Methods: The conceptualization and operationalization of this study are problematic. This study has shown a low degree of novelty. No clear problem statement nor research gap is highlighted. No details of data collection.

Author: Thank you very much for the suggestions. The gap has been added in line 115–118.

Results: Therefore, I am not convinced by the findings.

Author: Thank you very much for the suggestions. The findings have been improved by conducting robustness checks in line 426–503.

Interpretation: The interpretation of the findings is rather weak and not rigorous.

Author: Thank you very much for the suggestions. The interpretation of findings has been improved in line 375–492.

Other comments: Need to highlight the theoretical and practical of this study.

Author: Thank you very much for the suggestions. The theoretical and practical of this study have been added in line 121 –125.

Reviewer 5: Methods: The method used is descriptive method using documentary analysis. However, the documents analyzed did not cover countries included in the sample respondents. The analysis of findings would have been more comprehensive and exciting to readers if name of countries were included in the findings.

Author: Thank you very much for the suggestions. The list of countries in the study has been added in Appendix Table A.

Results: The results of the study is comprehensive, however if there is labelling of countries included in the variables it would have more exciting.

Author: Thank you very much for the suggestions. The list of countries in the study has been added in Appendix Table A.

Interpretation: The interpretation based from statistical analysis of the document is comprehensive.

Author: Thank you very much for the comments.

Other comments: Labelling countries in the demographic typology is recommended.

Author: Thank you very much for the suggestions. The list of countries in the study has been added in Appendix Table A.

Reviewer 6: Methods:

Results:

Interpretation:

Other comments:

Reviewer 8: Methods: The methods employed by the author(s) are suitable. However, there is need to first specify the implicit function of

the model before the explicit function. In addition, the specified model is not correctly specified without the subscript 'it'. It looks more like a time series model.

Author: Thank you very much for the comments. The models have been revised in line 282–283 and 297–303.

Results: The results are adequately explained. Although there is a need for theoretical framework to link all parts of the study.

Author: Thank you very much for the comments. Theoretical framework to link all parts of the study have been added in, for example, line 372–373.

Interpretation: The explanation still lacks theoretical basis.

Author: Thank you very much for the comments. Theoretical basis has been added in, line 79–87.

Other comments: The issues raised by the author(s) are important and adequately addressed, but poor grammatical expressions alter the correct discussion of findings in the study. I hereby suggest a thorough editing by an expert in English language writing to edit the manuscript before publication.

Reviewer 9: Methods:

The process of subject selection was clear.

The variables were defined and measured appropriately.

The study methods were valid and reliable.

There is enough detail to replicate the study.

Author: Thank you very much for the comments.

Results:

The text in the results added to the data.

A statistically significant result was clear.

A practically meaningful result was clear.

Interpretation:

was clear

Author: Thank you very much for the comments.

Other comments:

Reviewer 10: Methods: clear enough; it needs more appropriate reasoning in choosing GMM estimator.

Author: Thank you very much for the comments. Reasoning in choosing GMM estimator has been addressed in line 285–290.

Results: clear enough

Author: Thank you very much for the comments.

Interpretation: Still using the old references for justifying the findings.

Author: Thank you very much for the comments. Recent references for justifying the findings have been added in line 79–87.

Other comments:

Data in Brief (optional):

We invite you to convert your supplementary data (or a part of it) into an additional journal publication in Data in Brief, a multi-disciplinary open access journal. Data in Brief articles are a fantastic way to describe supplementary data and associated metadata, or full raw datasets deposited in an external repository, which are otherwise unnoticed. A Data in Brief article (which will be reviewed, formatted, indexed, and given a DOI) will make your data easier to find, reproduce, and cite.

You can submit to **Data in Brief** when you upload your revised manuscript. To do so, complete the template and follow the co-submission instructions found here: [www.elsevier.com/dib-template](http://www.elsevier.com/dib-template). If your manuscript is accepted, your Data in Brief submission will automatically be transferred to Data in Brief for editorial review and publication.

Please note: an open access Article Publication Charge (APC) is payable by the author or research funder to cover the costs associated with publication in Data in Brief and ensure your data article is immediately and permanently free to access by all. For the current APC see: [www.elsevier.com/journals/data-in-brief/2352-3409/open-access-journal](http://www.elsevier.com/journals/data-in-brief/2352-3409/open-access-journal)

Please contact the Data in Brief editorial office at [dib-me@elsevier.com](mailto:dib-me@elsevier.com) or visit the Data in Brief homepage ([www.journals.elsevier.com/data-in-brief/](http://www.journals.elsevier.com/data-in-brief/)) if you have questions or need further information.

## Abstract

The goal of this study was to examine the nexus between demographic ~~change~~ ~~dividend type~~ and economic features with internet use. The data source was from the World Development Indicator of the World Bank. ~~The unit analysis was country. The Ppanel data analysis methods~~ were used for the examination, employing fixed effects regression ~~models using country income level, country regional group, and year as identifiers, random effects regression, and pooled least square models. The unit analysis was country.~~ The ~~random effects regression model, pooled least square model, and static~~ generalized method of moments ~~and two stage least square~~ were utilized ~~as for the~~ robustness checks. The dependent variable was the percentage of population using the internet. The independent variables consisted of demographic and economic variables. The demographic variable was the demographic dividend typology, while the economic variables were access to electricity, GDP, inflation rate, and foreign direct investment. The results of fixed effects regression indicate that ~~using country income level, country regional group, and year as identifiers and~~ after controlling for the economic features, higher internet use in a country was associated with late- and post-demographic dividend ~~typology type~~. Higher internet use was also associated with higher access to electricity, higher GDP, lower inflation rate, and higher foreign direct investment inflow. ~~The~~ Robustness checks using random-effects and pooled least square models, using fixed-effects model by country income level, using two-stage least square, and using second stage regression by G20 and non-G20 country group division ~~and year~~, similarly gave consistent results. ~~The association of internet use with the demographic and economic features may imply that population-based and economic development program should be enhanced toward the favorable ones that increase internet usage among the population.~~

Key words: Demographic dividend typology, economic determinants, internet use, fixed effects.

## 1. Introduction

The world is marked by a considerable inequality in human development achievement. The United Nations Development Programme (UNDP) reported that in 2019 the human development index (HDI) varied greatly from a lowest of 0.394 in Niger to a highest of 0.957 in Norway (UNDP, 2020). This disparity could be attributed to the inequity in access to digital technology, including broadband internet.

Widespread access to broadband internet is a key driver of human development. Improving access to the internet is also identified as an instrument to achieve the Sustainable Development Goals (SDGs) in goal 4 (Quality education), goal 9 (Industry, innovation, and infrastructure), and goal 17 (Partnership for the Goals). Internet allows people to be connected, work, shop, and study especially during the COVID-19 pandemic lockdowns (United Nations, 2021).

Formatted: Font color: Text 1

Internet can be used as an instrument to develop an economy and to pursue a more developed economy. Adaloro and Itasanmi (2016) argued that internet increases the participation and motivates illiteracy alleviation. Internet is also an effective means in adult literacy program. Further, study by Kouton (2019) found that the use of internet reduced energy demand used for heating and transportation. This saving allowed the government to allocate energy generator budget to other sectors.

The World Bank (2022) estimated that increasing internet penetration from 35% to 75% of the population in all developing countries could increase about US\$2 trillion to their joined gross domestic product and generate more than 140 million works around the world. However, there were a great inequality in the internet access across the world.

Formatted: Font color: Text 1

The World Bank (2021) reported that in 2019, among 174 countries in the world where the data was available, this access varied greatly across countries, lowest in Burundi (5.2%) and almost universal in Bahrain (99.7%).

Information and communication technology (ICT), in particular internet, is a most developed business and business product in this century. The study of ICT encounters economists and demographers with two sides, as consumers and producers. As it can be seen from Figure 1, there was a rapid increase of internet consumers in the world. The percentage of internet users in the world from 1990–2018 increased from 0% in 1990 to 51% in 2018 only in 28 years. The time trends of the percentage of internet users was not the linear one, but the power one. Therefore, the internet business is a promising one.

~~Improving access to the internet is also identified as an instrument to achieve the Sustainable Development Goals (SDGs) in goal 4 (Quality education), goal 9 (Industry, innovation, and infrastructure), and goal 17 (Partnership for the Goals). Internet allows people to be connected, work, shop, and study especially during the COVID-19 pandemic lockdowns (United Nations 21). However, there were a great inequality in the internet access across the world.~~

**Figure 1**  
**Individuals Using the Internet (% of population): World 1990-2018**

On the other hand, decline in fertility and mortality level and change in migration patterns have caused countries to experience demographic change that has been related to demographic dividend. Demographic dividend is economic growth as the results of changes in age structure in a country due to the decline in family size and longer life that cause increase in the percentage of productive age population aged 15–64 years old. As a result, lower investment is needed for young population aged 0–14 years old. At the same time, productive age population increases that open the window of opportunity to accelerate economic growth and family welfare. At micro level, this demographic transition can result in family living standard improvement and higher income. At macro level, demographic transition can affect economic development in a country.

It is proposed that demographic change can have a positive contribution to development (e.g. Ahmed et al. 2016), including economic and information and communication technology development. Demographic change of fertility and mortality decline could help create a period

of sustainable economic growth as happened in some East Asian economies (e.g. Bloom et al., 2020; Amornkitvikai, Y. et al., 2022, Hosan et al., 2022, Liu and McKibbin, 2022). The mechanism of growth that is the policy area is through public health, family planning, economic policy that promote labor market flexibility, trade openness, and saving. The government of countries has window of opportunity to capitalize productive age population to reap the demographic dividend of economic growth and family welfare acceleration. This economic growth then enables countries to enlarge their heavily internet-based economies and consequently rises internet usage (Pradhan et al., 2017; Anuj, et al. 2018; Amaluddin 2020).

Bonus demografi adalah pertumbuhan ekonomi yang merupakan hasil dari perubahan struktur umur sebuah negara, perubahan dari sebuah keluarga yang besar berumur pendek menjadi keluarga kecil dan berumur berumur lebih panjang.

Karena perubahan dalam distribusi umur, diperlukan investasi yang lebih sedikit untuk membangun penduduk kelompok usia mudda dan kemudian sumberdaya yang lebih besar digunakan untuk pembangunan (economic gift). Berbarengan dengan hal tersebut, Angkatan kerja bertumbuh lebih cepat (more rapidly) dibandingkan dengan penduduk yang tergantung padanya menciptakan sebuah jendela kesempatan percepatan pertumbuhan ekonomi dan kesejahteraan keluarga. Dalam skala mikro, transisi ini dapat berbuah dalam perbaikan standar hidup keluarga dan pendapatan yang lebih tinggi. Dalam tingkat makro hal ini dapat mempengaruhi perkembangan ekonomi sebuah negara.

-Ahmed et al. (2016) grouped countries into four demographic dividend typology-type based on the demographic change and economic development achievement. The demographic dividend typology is classified as the pre-, early-, late-, and post-demographic dividend. Countries with a fertility level above four children per woman, increasing percentage of working age population (15–64 years), and low income level are categorized as the pre-demographic dividend countries. Meanwhile, countries with a fertility level between 2.1 and four children per woman, increasing percentage of working age population, and low-middle and middle-high income level are categorized as the early-demographic dividend countries. Further, countries with a fertility level below 2.1 children per woman, increasing percentage of working age population, and high income level are also categorized as the early-demographic

dividend countries. Furthermore, countries with a fertility level between 2.1 children and four per woman, declining percentage of working age population, and low, low-middle, and middle-high income level are categorized as the late-demographic dividend countries. Lastly, countries with a fertility level below 2.1 children per woman, decreasing percentage of working age population, and high income level are categorized as the post-demographic dividend countries.

~~It is proposed that demographic change can have a positive contribution to development (e.g. Ahmed et al. 2016), including information and communication technology development. As it can be seen from Figure 2, there was a significant difference in the percentage of internet users and its trends across the demographic dividend typologies. The percentage of internet users was consistently highest in the post-demographic dividend countries, followed by in the late- and early-demographic dividend countries, and lowest in the pre-demographic dividend countries. It also can be seen that during 1990–2018 the percentage of internet users during 1990–2018 increased more rapidly in more developed countries, the post-demographic dividend typology countries.~~

~~The determinants of internet use have been proposed (e.g. Scheerder et al. 2017). These include demographic and socioeconomic factors. The association between demographic and economic features and information and communication technology has also been studied (e.g. Bianchini et al. 2021; Yesuf, 2021; Singh et al. 2020; Baumann et al. 2017). However, a summary of the reviewed literature revealed that no study on demographic dividend type and internet use had been carried out. In order to address the gap indicated above, in general this study sought to~~

~~standar hidup keluarga dan pendapatan yang lebih tinggi. Dalam tingkat makro hal ini dapat mempengaruhi perkembangan ekonomi sebuah negara.~~

Espinoza Bianchini, G., Navia, P., & Ulriksen Lira, C. (2021) melakukan studi tentang dampak umur, identifikasi ideological pada pemakaian jaringan sosial on line untuk mendapatkan informasi politik. Indikator sosio-demographic dan indentifikasi ideologikal, akses serta pemakaian jaringan sosial ditemukan mempengaruhi keterlibatan demokratis. Di negara-negara di mana digital divide (akses ke internet) dan digital inequality (penggunaan internet) terjadi berdampingan (Coexist), dampak indikator sosio-demografis lebih kuat, karena mereka yang memiliki lebih sedikit alat dan sumber daya mempunyai lebih sedikit akses dan lebih sedikit menggunakan jejaring sosial. untuk keterlibatan demokratis.

Yesuf, K. A. (2021) melakukan studi untuk menginvestigasi determinan sosiodemographic internet dan dampaknya pada perilaku keluarga berencana diantara laki-laki muda (young male) di Ethiopia menggunakan data dari Ethiopia health and demographic survey 2016. Besarnya penggunaan internet di Ethiopia (magnitude of internet use) sebesar 14% berasosiasi dengan dengan pemakaian internet adalah umur 20-24 tahun, tingkat Pendidikan yang tinggi, hidup pada region kota administrative, menggunakan mobile phone, responden yang dapat membaca seluruh kalimat, dan responden yang mempunyai computer dirumah. Responden dengan pekerjaan di sector pertanian dan pekerja manual kurang cenderung menggunakan internet.

Singh, S., Sahni, M. M., & Kovid, R. K. (2020). Melakukan studi bahwa kegunaan yang dirasakan (Perceived usefulness) dan Pengaruh social (social influence) merupakan determinan

kunci niat perilaku menggunakan layanan Fintech. Selanjutnya ditemukan bahwa digital behavior serta karakteristik demografi (umur dan gender) memperkuat hubungan tersebut

Filippova, I., & Turutina, E. (2015) menggunakan sampel yang merupakan representasi seluruh penduduk Rusia melakukan studi mengukur secara empiris penggunaan internet dalam proses Pendidikan di Rusia. Perbedaan umur dan gender, finansial status, dan tingkat Pendidikan merupakan determinan penggunaan internet untuk tujuan pendidikan.

Online health information seeking behavior (OHISB) is currently a widespread and common behavior that has been described as an important prerequisite of empowerment and health literacy. Baumann, E., Czerwinski, F., & Reifegerste, D. (2017). Ditemukan bahwa factor demografi seperti status sosio ekonomi, umur, gender merupakan determinan penting untuk OHISB. Wang, J., Xiu, G., & Shahzad, F. (2019) selain faktor kunci untuk OHISB seperti self-efficacy, Internet experience, and perceived ease of use, membagi determinan OHISB ke dalam empat kategori yakni demographic characteristic factors, cognitive factors, internal factors, and external factors.

Sharma, S. K., Govindaluri, S. M., & al Balushi, S. M. (2015) melakukan riset mengeksplorasi determinan utama dari pemakai internet banking. Menggunakan Two staged regression ditemukan bawah service quality, trust, perceived usefulness, perceive ease of use, attitude and demographic variabels merupakan dterminan internet banking users.

Pertumbuhan ekonomi dipengaruhi secara signifikan oleh digitalisai dan transisi demographi (Zaman, K. A. U. and T. Sarker., 2021). Menggunakan Bangladesh sebagai sebuah case study, Zaman dn Sarker mengadopsi model three stage least square menganalisis bagaimana digitalisasi, dan transisi demographi mempercepat pertumbuhan ekonomi di Bangladesh.

Setiap kenaikan 1% jumlah pengguna internet, GDP akan meningkat sebesar 0,11%, ceteris paribus. Sementara itu setiap penurunan 10 basis poin dalam dependency ratio akan meningkatkan GDP sebesar 1,2%. Faktor kunci untuk digitalisasi adalah labor participation rate, produktivitas pekerja, dan mobil penetration. Urbanisasi secara bolak-balik mempengaruhi peningkatan pemakai internet. Skor Human Development Index (HDI) dan angka urbanisasi secara negative signifikan berpengaruh pada angka ketergantungan, sementara itu partisipasi perempuan dalam Angkatan kerja mempunyai pengaruh positif.

Zaman, K. A. U. and T. Sarker. 2021. Demographic Dividend, Digital Innovation, and Economic Growth: Bangladesh Experience. ADBI Working Paper 1237. Tokyo: Asian Development Bank Institute. Available: <https://www.adb.org/publications/demographicdividend-digital-innovation-economic-growth-bangladesh>

Bonus demografi memainkan peran penting sehubungan dengan hampir 850 Juta pelanggan langganan seluler (4 kali penetrasi Internet yang mencapai sekitar 205 Juta) di India (Burrage, V.,2017). Pasca liberisasi ekonomi India, pengembangan system perbankan mengalami pertumbuhan yang sama dengan penduduk. Sering dengan pertumbuhan penduduk, permintaan dan tantangan juga meningkat dalam perkembangan system perbankan dan pembayaran. Untuk mengangani permasalahan ini pemerintah India mendisain sangat banyak strategi untuk meningkatkan ekonomi massa di India. Pemerintah India memulai program inklusi keiangan untuk mendapatkan pertumbuhan yang berkesinambungan melalui isu sosial seperti pengentasan kemiskinan (removing poverty), pendidikan untuk semua, dan well balance society melalui sitem keuangan dapat diperkuat. Seknario ini berbuah banyak (fruitful) karena India mempunyai advantage of demographic advantage, technological advancement, dan financial literacy, penignkatan penetration of Internet technology, dan juga penetration of mobil technology melalui smartphone. Demographic dividen memainkan sebuah peranan krusial. Hal ini mendorong perkembangan dan sebuah kompetisis yang lebih ketat dalam system pembayaran diluar insitusi.

Myovella, G., Karacuka, M., & Haucap, J. (2021) melakukan studi tentang determinants of digitalization and digital divide in Sub-Saharan African economies. Hasil temuannya adalah bahwa GDP per capita, gross capital formation, political stability, regulatory efficacy and electricity infrastructure secara langsung mempengaruhi digital divide. Juga ditemukan bahwa GDP per capita, population growth, government consumption, trade openness, and electricity infrastructure secara tidak langsung mempengaruhi digital divide melalui efek spillover (spillover effects)

**Formatted:** Justified, Line spacing: 1.5 lines, Don't hyphenate

Pertanian merupakan sebuah sector kunci dalam mendorong pertumbuhan ekonomi dan pengentasan kemiskinan di Vietnam (Giang, M. H., Xuan, T. D., Trung, B. H., & Que, M. T., 2019). Produktivitas diukur sebagai Total Factor Productivity. Determinan dari TFP di Vietnam termasuk size and age, share of state and foreign ownership, export, accessibility to Internet and bank loan of firms.

Teknologi internet telah menjadi perangkat teknologikal esensial untuk individu, organisasi, dan pendorong pertumbuhan serta kemakmuran negara (Isaac, O., Abdullah, Z., Ramayah, T., & Mutahar, A. M., 2018). Negara seperti Yaman dimana terdapat pemakaian internet yang sangat rendah kita lihat mempunyai kemajuan ekonomi, sosial dan kultural yang rendah.

Inovasi dan kewirausahaan merupakan factor pendorong penting untuk pertumbuhan ekonomi, dan internet memainkan sebuah peranan penting dalam aktivitas kewirausahaan. Menggunakan dataset dari China Family Panel Studies (CFPS) dataset in 2014 and 2016, Tan, Y., & Li, X. (2022) melakukan studi dan menemukan bahwa internet mempunyai pengaruh signifikan dan positif pada kewirausahaan di China. Juga ditemukan bahwa internet mendorong (promote) kewirausahaan dan menolong pengusaha memperoleh pendanaan informal.

Pemakaian luas mobile phot dan pertumbuhan penetrasi internet telah menciptakan sebuah kesempatan unit untuk meningkatkan pelayanan keuangan. Perusaann Financial Technology (FinTech) dan mobile banking (m-banking) membedakan konsumen menggunakan platform digital menggunakan jasa finansial tanpa dipelukan akses fisik sebagaimana yang terjadi pada bank tradisional (Slazus, B. J., & Bick, G. ,2022). Pertumbuhan FinTech berdampak pada pertumbuhan ekonomi keluarga dan sebuah bangsa.

Teknologi ingernet telah memecahkan batas batas ruang geographical tradisional. mempersingkat jarak tempuh antar wilayah, memaksimalkan integrasi berbagai sumberdaya. Dalam era teknologo digital, perkembangan jaringan internet yang cepat, dapat menghemat pemakaian dan konsumsi energi (Ren, S., Hao, Y., Xu, L., Wu, H., & Ba, N. ,2021).terjadi hhubungan negatif antara pengebangan internet dengan struktur konsumsi energi melalui pertumbuhan ekonomi, investasi R&D, human capital, financial development dan struktur industrial di China.

Wu, S., Wang, P., & Sun, B. (2022) menggunakan city level data from China for the period 2003-15 menemukan bahwa internet mempengaruhi disparitas ekonomi antar kota di Chian melalui dampak heterogeneous pada pertumbuhan ekonomi. Internet memperlebar disparitas ekonomi antar kota dengan angka penetrasi internet yang rendah dan kota dengan angka penetrasi internet yang tinggid.

Bianchini et al. (2021) studied the impacts of age and ideological identification on the use of online social network to obtain political information. They found that socio-demographic factors had strong impacts on internet use. Meanwhile, a study in Ethiopia by Yesuf (2021) found higher internet use among those who were aged 20–24 years, had higher education, lived in urban areas, had a mobile phone, literate, had a personal computer, and worked in formal sectors. Further, a study by Singh et al. (2020) found that perceived usefulness and social influence were the key determinants of the use of Fintech services. They also found that age and gender also influenced this behaviour.

The importance of demographic and socioeconomic factors on internet use for health purposes were also found. Studies by Baumann et al. (2017) and Wang et al. (2019) found age, gender, and socioeconomic factors were important determinants of online health information-seeking behaviour.

Studies also found the significance of demographic and socioeconomic determinants in internet use for financial purposes. A study in Russia by Filippova and Turutina (2015) found that age, gender, financial status, and education level were the determinants of internet use for education

purposes. Meanwhile, Sharma et al. (2015) found the importance of demographic variables in internet use for banking purposes.

A study by Burragoni (2017) found that demographic dividend played an important role in 850 million cellular subscriptions in India. In the post-economic liberalization, banking system development grew together with the population. Together with economic growth, demand and challenges in banking and payment system development also grew.

Myovella et al. (2021) studied the effects of demographic and economic features on digitalization and digital divide in Sub-Saharan African economies. They found that GDP per capita, gross capital formation, trade openness, population growth, and electricity infrastructure influenced digital divide. Meanwhile, low internet use was found related to low economic, social, and cultural development. A study in Yaman by Isaac et al. (2018) found that low internet use was associated with low economic, social, and cultural development. Another study in Indonesia also found the importance of access to electricity in internet use (Amaluddin,-2020).

Mungkin salah satu pertanyaan dan yang menyita banyak perhatian dalam literatur ekonomi adalah : mengapa sejumlah negara lebih kaya dibandingkan dengan negara lain” (Solow, 1956). Solow suggested bahwa perbedaan dalam angka pertumbuhan pada akumulasi kapital dapat mengakibatkan perbedaan dalam output per kapital. Selanjutnya Lucas (1988), disparitas dalam human capital merupakan central role dalam analisis pertumbuhan dan perkembangan. Selanjutnya Klenow dan Rodriguez-Clare (1997), Hall and Jones (1999), Parente dan Prescott (2000) dan kemudian Bils dan Klenow (2000) berargumen bahwa perbedaan output per pekerja tidak diakibatkan oleh perbedaan dalam human capital (atau physical capital) tetapi oleh perbedaan dalam sebuah residual yang dinamakan Total Factor Productivity (TFP)

Total factor productivity (TFP) kemudian merupakan sebuah ukuran produktivitas dihitung dengan membagi total produksi dengan rata-rata tertimbang dari input, yakni tenaga labor dan capital. Human capital diperkaya dengan internet dan internet merupakan physical capital yang sangat berkembang pada revolusi Industri 4.0.

Pertumbuhan internet nampaknya memainkan peran yang lebih penting dalam meningkatkan produktivitas factor hijau di Cina (Li, T., Han, D., Ding, Y., & Shi, Z.,2020). Green Total Factor Productivity merupakan pilihan yang tak terelakkan untuk secara berkesinambungan meningkatkan kualitas ekonomi China, dan juga promote global development. Sejumlah factor seperti Internet development, human capital, urbanization, energy efficiency, and external dependence all exert a positive influence on China's green total factor productivity

Formatted: Line spacing: 1.5 lines

Song, Y., & Liu, H. (2020) menunjukkan bahwa internet memperbaiki TFP di sejumlah pelabuhan Sungai Yangtze. Juga ditemukan bahwa pengembangan internet pada area dengan tingkat perkembangan ekonomi yang lebih rendah memperbaiki TFP. Pengembangan internet relevan untuk pembangunan ekonomi.

Formatted: Justified, Line spacing: 1.5 lines, Don't hyphenate

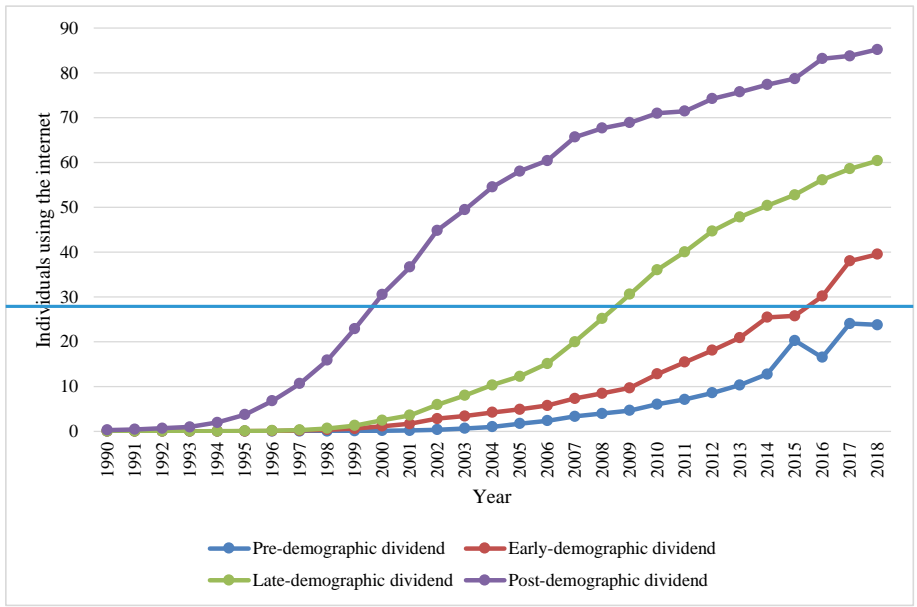

Zelenyuk, V. (2014) mengembangkan sebuah kerangka kerja menguji dan mendapat signifikansi dari dampak teknologi informasi dan komunikasi pada distribusi produktivitas tenaga kerja pada negara berkembang pada tahun 1980-1995. Internet of Things (IoT) merupakan sebuah innovational complementary pada ICT dan berimplikasi pada pertumbuhan Total Factor Productivity (Edquist, H., Goodridge, P., & Haskel, J.,2021).

Formatted: Not Highlight

Jika internet merupakan factor pertumbuhan ekonomi, maka studi ini mempelajari factor faktor yang mempengaruhi pertumbuhan dan pemakaian internet.

**Figure 2**  
**Individuals Using the Internet (% of population) by the Demographic Dividend Typology**

Internet can be used as an instrument to develop an economy and to pursue a more developed economy. Adelere and Itasanmi (2016) argued that internet increases the participation and motivates illiteracy alleviation. Internet is also an effective means in adult literacy program. Further, study by Kouton (2019) found that the use of internet reduced energy demand used for heating and transportation. This saving allowed the government to allocate energy generator budget to other sectors.

The use of internet and access to digital devices are continuously increasing in all parts of the world (Horn & Rennie 2018). For example, in Sarawak in Borneo island, Malaysia, a number of remote villages were lack of infrastructure, such as asphalt road and electricity network. But, a number of people had a mobile phone and internet access.

Salahuddin and Alam (2015) studied the association between the internet usage, electricity consumption, and economic growth in Australia. They found that bidirectional causal link

~~between higher electricity consumption was associated with higher electricity consumption~~  
internet usage and economic growth.

Stork et al. (2013) analyzed internet access and use trends in some African countries in 2007/2008 and 2011/2012. They found that the use of internet increased very significantly in these countries despite of some barriers, such as large-scale computers and expensive connectivity costs. In addition, mobile phone had been used as key entry point to internet use. As a result, the internet penetration increased by 11.5% in these countries from 2007/2008 to 2011/2012.

Meanwhile, Nigeria experienced economic growth as an impact of ICT business and telecommunication liberalization during the 2000s (Akinwale et al. 2018). There was a co-integration between ICT and economic growth in the long run. In the short run, only with secure internet server per 1 million and mobile cellular subscription per 100 people resulted in positive and significant impact on economic growth.

Gholizadeh et al. (2014) studied the relationship between gross domestic product (GDP) and internet use in some ASEAN countries during 1996–2011. They found that there was a positive and significant association between internet use and GDP, although there were differences between those ASEAN countries. Meanwhile, a study by Bahrini & Qaffas (2019) in the Middle East and North Africa (MENA) and Sub-saharan Africa (SSA) found that ICT, i.e. mobile phone, internet usage, and broadband adoption were the main driver of economic growth during 2007–2016.

Internet fosters economic growth (Jiménez et al. 2014). An increase of 10% in internet connectivity was found to boost up GDP growth by 1.38% in the world. In OECD countries, high internet access generated GDP by 2%.

Meanwhile, Salahuddin et al. (2016) studied the effects of internet and real GDP on social capital creation measured by trust in Australia during 1985–2013. They found that internet increased social capital in the short run, but reduced social capital in the long run. In addition, there was a short and long run positive relationship between internet and GDP per capita.

Not only in developing countries that internet affects economic growth. Amiri & Reif (2013) in their study in Nordic region found that in countries with highest internet penetration there was an association between highest internet penetration and highest GDP per capita in the world.

Internet penetration is determined by a number of factors. Feng (2015) studied the factors influencing internet penetration in China. It was found that internet penetration was mainly affected by internet access cost, internet content, and GDP per capita.

Meanwhile, a study by Lera-López et al. (2011) found that socioeconomic, demographic, and regional factors influenced internet use. The use of internet was primarily associated with education, age, occupation, employment in service sector, nationality, living in urban areas, and regional GDP per capita. They also found that internet use was positively related with broadband connection and education, while internet skill was influenced by gender and population size.

The relationship between inflation and internet use has also been studied. Yi & Choi (2005) found that internet improved productivity and reduced inflation. An increase of 1% in the ratio of the internet users to total population reduced inflation from 0.04264% point to 0.13193% point. Subsequently, inflation has a positive effect on internet demand.

The new economic theory proposed that humankind is entering an era with high output growth, low unemployment, and low inflation (Meijers, 2006). It is described that inflation suppresses internet growth and on the other side, internet will increase inflation in the long run. Sharma et al. (2014) studied the relationship between inflation and internet use through online shopping in India. They found that inflation had an indirect effect on internet growth.

Choi (2003) investigated the effects of internet on the volume of inward foreign direct investment (FDI). Internet was assumed to boost up higher FDI through productivity improvement. Using 53 FDI recipient country data and FDI gravity equation it was found that when the number of hosts and internet users in a country increased by 10%, FDI inflow increased by more than 2%.

The international community supports developing countries by building up digital infrastructure and regulation in order to be able to participate in international trade, in particular through larger diversification series in export. The study by Gnanngnon (2020) using panel data from 131 countries during 1995–2014 found that greater internet access was positively associated with export diversification in particular both in less developed and developed countries. Internet access creates innovation level of a country, merchandise export including its concentration export products, and the size of inflow FDI. The results of this study emphasized the need of digital infrastructure development and regulation that facilitate access to the internet.

Pradhan et al. (2017) also studied the association between FDI, economic growth, and use of communication technology in 21 Asian countries during 1965–2012. Communication technology included fixed telephone, mobile phone, and internet use and service including fixed broadband. The results of the study show that there was a positive association between FDI, economic growth, and communication technology. Using the Granger causality analysis, these three variables were positively related.

A study on the association between FDI and internet use in 10 ASEAN countries had been carried out (Ramdan et al. 2020). It was found that higher internet use was associated with higher FDI. A 1% increase in FDI was associated with a 0.0681 increase in internet use.

Formatted: English (United States)

Based on the above literature review, ~~this study aims to investigate the association between demographic and economic factors with internet use in the world.~~ It is hypothesized that higher internet use is associated with higher demographic dividend typology, higher access to electricity, higher GDP, lower inflation, and higher FDI.

### 2.3. Data and Methods

This study used data from the World Bank (2021). The unit of analysis was country, covering 186 countries in the world. The study period was from 2001 through 2017. Therefore, there were 3,162 observations in this study. The countries and study period were selected based on the availability of data on variables used in the study. In addition, the selected countries were classified by demographic dividend type by the World Bank (Appendix Table A).

The dependent variable was the information technology, that is the individuals using the internet (% of population). The independent variables were the demographic variable and economic variables. The demographic variable was the type of demographic dividend (TDD) which was a categorical variable (=0 if pre, =1 if early, =2 if late, and =3 if post). Therefore, there were three (3) dummy variables for TDD, that is *EarlyDD* (=1 if early, =0 otherwise), *LateDD* (=1 if late, =0 otherwise), and *PostDD* (=1 if post, =0 otherwise), and pre-demographic dividend was the reference category. Meanwhile, the economic variables included access to electricity (% of population, *Electric*), gross domestic product (constant 2010 US\$, *GDP*), inflation, consumer prices (annual %) (*Inflation*), and foreign direct investment (*FDI*), net inflows (% of GDP).

This study employed panel data analyses. The econometric model used was a fixed effects regression model using income level group, regional group, and year as identifiers. This model was also carried out based on G20 country group and income level group. The proposed model in this study was as follows.

Formatted: Font: (Default) Times New Roman

$$Internet_{it} = \beta_0 + \beta_{11}EarlyDD_{it} + \beta_{12}LateDD_{it} + \beta_{13}PostDD_{it} + \beta_2Electric_{it} + \beta_3 \ln(GDP)_{it} + \beta_4 Inflation_{it} + \beta_5 FDI_{it} + \varepsilon$$

Formatted: Font color: Black  
Formatted: Normal, Indent: Left: 0.25", No bullets or numbering

This fixed effects regression model still had endogeneity problem and measurement errors in the variables used. The demographic dividend type can influence internet use and on the other hand internet use can affect the demographic dividend type. In addition, the demographic dividend type is endogenous, that is a variable that is influenced by other variables. Therefore, other approaches were employed as robustness checks using the static generalized method of moment (GMM). This GMM is a simultaneous model between an endogenous variable and instrument or exogenous variables in the first stage regression and an endogenous model between the dependent variable and independent variables in the second stage regression. The instrument variables used consisted of crude death rate (deaths per 1,000 people, CDR), population density (population per km<sup>2</sup>, Density), and crude birth rate (births per 1,000 people, CBR).

The first stage regression model was as follows.

Formatted: Font: (Default) Times New Roman

$$TDD_{it} = \alpha_0 + \alpha_{11}CDR_{it} + \alpha_{12}Density_{it} + \alpha_{13}CBR_{it} + \alpha_2Electric_{it} + \alpha_3 \ln(GDP)_{it} + \alpha_4 Inflation_{it} + \alpha_5 FDI_{it} + \varepsilon$$

The second stage regression model was as follows.

$$Internet_{it} = \beta_0 + \beta_{11}EarlyDD_{it} + \beta_{12}LateDD_{it} + \beta_{13}PostDD_{it} + \beta_2Electric_{it} + \beta_3 \ln(GDP)_{it} + \beta_4 Inflation_{it} + \beta_5 FDI_{it} + \varepsilon$$

The endogeneity problem can result in biased and inconsistent estimates when there is lag in dependent variable. This problem can be solved by employing the dynamic panel GMM model. Arellano and Bond (1991) proposed the GMM approach. There are two reasons of applying GMM approach. First, GMM is a common estimator that gives a framework for comparison and evaluation. Second, GMM gives simple alternative to other estimators in particular maximum likelihood.

However, GMM estimators also have some limitations. First, GMM estimator is asymptotically efficient if the sample size is large, but inefficient if the sample size is finite. Second, the estimator sometimes needs a number of programming implementation so that it needs software that can support GMM approach application.

There are three estimation methods that are commonly used in GMM framework, that is first-differences GMM (FD-GMM) or Arellano-Bond GMM (AB-GMM), system GMM (SYS-GMM), and “difference” and “system” GMM dynamic panel estimator. This study employed “difference” and “system” GMM dynamic panel estimator to analyze the estimators. This model was selected because the demographic dividend type was time invariant and the model can solve this problem.

This study used data from the World Bank (2021). The unit of analysis was country, covering 186 countries in the world. The study period was from 2001 through 2017. Therefore, there were 3,162 observations in this study. The dependent variable was the information technology, that is the individuals using the internet (% of population). The independent variables were the demographic variable and economic variables. The demographic variable was the typology of demographic dividend that consisted of pre-, early (*EarlyDD*), late (*LateDD*), and post-demographic dividend (*PostDD*) with pre-demographic dividend typology as the reference category. Meanwhile, the economic variables included access to electricity (% of population,

*Electric*), gross domestic product (constant 2010 US\$, *GDP*), inflation, consumer prices (annual %) (*Inflation*), and foreign direct investment (*FDI*), net inflows (% of GDP).

Data in this study were analyzed using univariate, bivariate, and multivariate analyses. For the univariate analysis, the percentage distribution of countries by the demographic dividend typology and the summary statistics (the number of observations, the mean, standard deviation, minimum, and maximum) of the continuous variables in the model were given. For the bivariate analysis, the average percentage of individuals using the internet by the demographic dividend typology and simple regression analyses between the internet use and economic variables were performed. For the multivariate analysis, a multiple regression with random effects was carried out to investigate the demographic and economic determinants of internet use in countries in the world during 2001–2017. The model was as follows:

$$\text{Internet} = \beta_0 + \beta_{11}\text{EarlyDD} + \beta_{12}\text{LateDD} + \beta_{13}\text{PostDD} + \beta_2\text{Electric} + \beta_3\ln(\text{GDP}) + \beta_4\text{Inflation} + \beta_5\text{FDI} + \varepsilon$$

### 3.4. Results

The results of univariate analysis are presented in Figure 3 and Table 1. It can be seen from Figure 3 that the majority of countries in the world were in early demographic dividend typology (33.3%), followed by in late demographic dividend typology (27.4%), in post-demographic dividend typology (20.4%), and in pre-demographic dividend typology (18.8%). Meanwhile, it can be seen from Table 1, the percentage of individuals using the internet ranged from none in Timor Leste in 2001 to almost universal of 98.3% in Iceland in 2017 and the percentage of population with access to electricity varied from a low of 0.53% in Liberia in 2001 to universal, 100%, in Iceland in 2017. Further, the GDP constant ranged between US\$143.2 thousand in Kiribati in 2001 and US\$17.4 trillion in the United States in 2017, the annual inflation (consumer prices) varied from a low of -18.1% in Bhutan in 2004 to a high of 359.9% in the Democratic Republic of Congo in 2001, and the current net inflows foreign direct investment differed from -58.2% in Luxembourg in 2007 to 56.5% in Malta in 2007.

The results of bivariate analysis are displayed in Figure 4–Figure 8. These are the average percentage of individuals using the internet by the demographic dividend typology (Figure 4) and the scatter diagrams, simple regression equations and lines, and coefficient determinations between each independent variable in the model and the dependent variable (Figure 5–8). It can be seen from Figure 4 that the average percentage of individuals using the internet was

lowest in pre-demographic dividend typology countries (5.5%) and highest in post-demographic dividend typology countries (61.5%).

Figure 5 shows that there was a positive relationship between access to electricity and internet use. An increase of one percent in population with electricity was related with an increase of about 0.56% in the individuals using the internet. The coefficient of determination was 0.366 indicating that 37% of the variation in the individuals using the internet can be explained by the variation in the access to electricity.

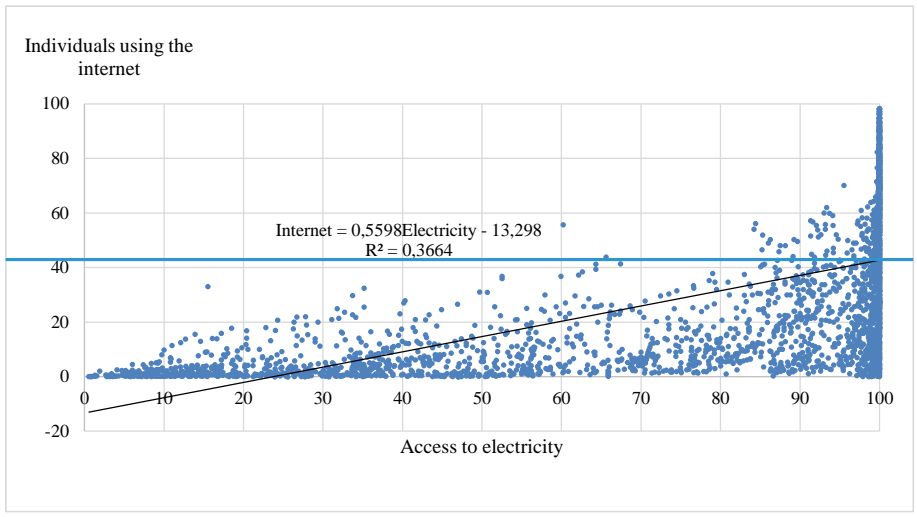

Figure 6 shows that there was a positive relationship between ln(GDP) and internet use. An increase of one percent in economic growth (GDP constant 2010) was correlated with an increase of about 0.35% in the individuals using the internet. The coefficient of determination was 0.0008 suggesting that ln(GDP) can explain the variation in the individuals using the internet by 0.08%.

Figure 7 indicates that there was a negative relationship between inflation and internet use. An increase of one percent in inflation was related with a decline of about 0.43% in the individuals using the internet. The coefficient of determination was 0.029 indicating that 2.9% of the variation in the individuals using the internet can be explained by the variation in inflation.

Source: World Bank (2021) (Author's compilation).

**Foreign direct investment (net inflows, % of GDP) and Individuals using the internet (% of population): World 2001–2017**

It can be seen from Figure 1 the majority of countries in the world were in early-demographic dividend type (33.3%), followed by in late-demographic dividend type (27.4%), in post-demographic dividend type (20.4%), and in pre-demographic dividend type (18.8%). The majority of countries in early-demographic dividend type were African countries, such as Angola, Benin, Chad, Eritrea, Kenya, Niger, Sudan, Togo, Uganda, and Zambia (Appendix Table A). Meanwhile, most developed countries were in post-demographic dividend countries, such as Australia, Belgium, Canada, Denmark, Germany, Japan, Norway, Singapore, United Kingdom, and United States.

**Figure 1**  
**Percentage distribution of countries by demographic dividend typology (%):**  
**World 2001–2017**

The number of observation and mean of variables used in the study both for full observations and by demographic dividend type was presented in Table 1. It can be seen that there was a significant variation in internet use across countries in the world and across demographic dividend types. The mean of individuals using the internet was 30.5% for full observations, lowest in pre-demographic dividend countries (only 5.5%), 18.3% in early-demographic dividend countries, 39.7% in late-demographic dividend countries, and highest in post-demographic dividend countries (61.4%). Other variables also show disparities in demographic and economic features across countries and demographic dividend types that reflects better development achievement in more developed countries.

**Table 1. Number of observations (n) and mean of variables in the study for full observation and by demographic dividend type.**

Variable	Full Observation		Pre-Demographic Dividend		Early-Demographic Dividend		Late-Demographic Dividend		Post-Demographic Dividend	
	n	Mean	n	Mean	n	Mean	n	Mean	n	Mean
Individuals using the internet (% of population)	3,162	30.5	595	5.5	1,054	18.3	867	39.7	646	61.4
Access to electricity (% of population)	3,162	78.3	595	31.4	1,054	75.7	867	97.5	646	99.9

Formatted: Justified

The results of diagnostic tests show that the residual approached normal distribution but statistically not normal (Jarque-Bera normality test was 52.24 and  $\chi^2 = 4.5E-12$ ). But, this assumption only applies for certain models. This assumption is not used if random effects regression, GMM, instrumental variables, and two-stage least squares (2SLS) are used.

The results of multicollinearity test show that there was no variance inflation factor (VIF) that was greater than 10. The mean of VIF was 2.650. In addition, there was no pairwise correlations that was greater than 0.5. It means there was no multicollinearity indication in the model.

There was heteroscedasticity in the model.  $\chi^2 = 1,726.32$  and  $\text{Prob} > \chi^2 = 0.000$ . This problem was solved by using STATA application by making the model that improved standard errors (robust standard errors).

The results of Chow test show that fixed effects model was better than pooled least squares model ( $F(3, 3151) = 181.13, \text{Prob} > F = 0.000$ ). In addition, the results of Hausman test show that fixed effects model was better than random effects model ( $\chi^2 = 817.94$  and  $\text{Prob} > \chi^2 = 0.000$ ). Further, the results of Breusch and Pagan Lagrangian multiplier test show that random effects model was better than pooled least squares model.

The results of fixed effect regression using income level group, regional group, and year as identifiers show that in general demographic dividend had significant positive association with internet use (Table 2). After controlling for the economic features, the percentage of individuals using the internet was, respectively 6.5%–21% higher and 15%–39% higher in late-demographic dividend and post-demographic dividend countries than in pre-demographic dividend countries. This finding supported the results of a study by Lera-López et al. (2011) and Myovella et al. (2021) that found the role of demographic factor in increasing internet use in the world. More favorable demographic features, including being a late- and post-

demographic dividend country, had been an important factor of better development that could enhance access to information and communication technology including internet use.

Table 2 Results of Fixed Effects Regression based on Identifier.

Covariates	Identifier		
	Income level group	Regional group	Year
Early-Demographic Dividend	0.317 (1.221)	1.398 (1.425)	4.409*** (0.921)
Late-Demographic Dividend	6.507*** (1.542)	14.398*** (1.749)	21.101*** (1.588)
Post-Demographic Dividend	15.142*** (1.721)	30.349*** (1.939)	39.005*** (0.691)

Source: World Bank (2021) (Author's compilation).

Before a multiple regression was conducted, the multi-collinearity between the variables in the model were checked. It was found that there was no collinearity between variables in the model, except between the demographic dividend typology and electricity where the Spearman correlation coefficient was slightly above 0.7 (0.71). However, this did not have serious effects on the results of the regression. The results of the multiple fixed effects regression are given in Table 2. These include the regression coefficient, standard errors, and p value for each covariate. All covariates in the model had significant effects on internet use statistically. The coefficient of variation was 0.540 implying that 54.0% of the variation in the internet use could be explained by the model with a significance level below 0.001.

The demographic dividend typology was positively associated with the internet use. Late and post demographic dividend countries had higher percentage of individuals using the internet than pre-demographic dividend countries. After controlling for the effects of economic factors, the percentage of individuals using the internet was, respectively, 13.0% and 29.7% higher in the late and post demographic dividend countries than in the pre-demographic dividend countries. This result supports the finding by Lera López et al. (2011) on the importance of demographic factors on internet use. Countries with more advanced demographic change, that is late and post-demographic dividend typology had lower fertility levels and better economic development achievement so that individuals in these countries were more likely to have exposed to better development, including access internet than individuals in pre and early-demographic dividend typology countries.

Access to electricity was the strongest factor that affected-influenced internet use positively. The higher the percentage of population who had access to electricity, the higher the percentage of individuals using the internet. Other things being the same, an increase of one percent in the access to electricity was related to an increase of 0.27% - 0.16% - 0.29% in the internet use. This finding is in accordance with the finding by Myovella et al. (2021) Salabuddin and Alam (2015) that found the positive association between internet use and electricity consumption and internet use. Access to electricity can boost the electricity-based economic activity and in today's industrial internet of things era, it is a key factor of internet use since the internet cannot be used without electricity.

Economic growth was had the second strongest factor of and had a positive effect on the internet use. The higher the economic growth, the higher the percentage of internet use. Ceteris paribus, an increase of one percent in economic growth was associated with an increase of internet use by 4.61.650% - 1.958%. This result supports the study result by Pradhan et al. (2017) and Amaluddin (2020) that found a positive relationship between economic growth and internet use. Economic growth allows a country to expand its economy that today heavily depends on the internet and hence increases internet use.

Inflation had a negative relationship with the percentage of individuals using the internet. The higher the inflation in a demographic dividend typology, the lower the percentage of individuals using the internet. After controlling for the effects of other factors, an increase of

one percent in inflation was associated with a decline of the percentage of individuals using the internet by 0.1815% – 0.176%. This finding confirms the results of study by Yi & Choi (2005) that found a negative association between inflation and internet use. This is because inflation is a contributor of cost and price rise including internet cost that reduces internet use through the decline in people’s purchasing power including purchasing the internet because of the price rise across the economies.

Foreign direct investment (FDI) had a positive influence on internet use. The higher the FDI, the higher the internet use. An increase of one percent in FDI was related with an increase of the percentage of individuals using the internet by 0.0485%–0.052% . This results strengthens the study finding by Gnanon (2020) and Ramdan et al. (2020) that found a positive relationship between FDI and internet use through the capital addition-accumulation in an economy that can increase individuals’ access to the internet use.

The results of the above analyses also show that 16.5%–65.6% of variation in internet use was explained by demographic dividend type and economic features.

The above results still had heteroscedasticity and endogeneity effects problem. To obtain consistent and robust results, this study conducted robustness checks by employing other approaches and different sub-samples. The results were as follows.

This study presented the results of analyses employing fixed effects, random effects, and pooled least square model. The results of the three models gave consistent results that demographic dividend type had positive effects on internet use significantly. The percentage of individuals using internet was 13%–14% and around 30% higher in, respectively, late- and post-demographic dividend countries than in pre-demographic dividend countries (Table 3). In addition, higher percentage of individuals using internet was associated with higher percentage of access to electricity, economic growth, and FDI and associated with lower inflation. A one percent increase in, respectively, access to electricity, economic growth, FDI, and inflation was associated with, respectively, an increase of about 0.3%, 2%, and 0.05% individuals using internet and a decline of 0.2% individuals using internet.

In Table 4, the results of analyses of fixed effects regressions for full observation and by income group were presented. It can be seen that the results were consistent with the previous results of the positive association between demographic dividend type, electricity, economic growth, and FDI with internet use and negative association between inflation and internet use. In addition, the effect of demographic dividend was largest in upper middle income countries and insignificant in high income countries.

In Table 5, the results of analyses of fixed effects regression for full observation and by year were presented. It can be seen that the results were also consistent with the previous results of the positive association between demographic dividend type, electricity, economic growth, and FDI with internet use and negative association between inflation and internet use. In addition, the percentage of individuals using internet was significantly higher in early-demographic dividend countries than in pre-demographic dividend countries in 2007–2012 and in 2013–2017 with an increasing effect.

The 2SLS model used CDR, population density, and CBR as instrumental variables. The results of diagnostic test for instrumental variable in 2SLS and GMM model show that  $F(1, 3154) = 69.68$ , which was greater than 10, and  $\text{Prob} > F = 0.0000$ , meaning that the models had strong instrumental variables. In addition, the results for first stage regression show that Sanderson-Windmeijer (SW) first-stage chi-squared and F statistic was significant, meaning that all instrument variables were relevant or valid to explain the endogeneous variable (demographic dividend type). The results of the first stage regression of 2SLS model were presented in Table

6.

The results of second stage regression for full observations and based on income group were given in Table 7. It can be seen that the 2SLS method results for full observations were also consistent with the previous results. The percentage individuals using the internet was significantly higher in early-, late-, and post-demographic dividend countries than in pre-demographic dividend countries, but with much higher percentages than in the previous models. In addition, the percentage individuals using the internet was also significantly higher in countries with lower inflation and higher economic growth and FDI. By income group, demographic dividend type had significant positive effects on internet use in low and high income countries.

In this study, the comparison between the results of fixed-effects regression and 2SLS method based on G20 and non-G20 group was also carried out. The results were presented in Table 8. It can be seen that the results were consistent with the previous results that demographic dividend type had significant positive influence on internet use both in non-G20 and G20 countries.

**Table 8. The Results of Second Stage Regression based on G20 Country Group.**

Covariate	(2) Non-G20 countries		(4) G20-countries

The 2SLS method by year was also done. The results were presented in Table 9. It can be seen that the results were also consistent with the previous results that demographic dividend type had significant positive influence on internet use in all years. In addition, the percentage individuals using the internet was also significantly higher in countries with lower inflation and higher economic growth and FDI in all years.

#### 4.5. Conclusions

In this study the nexus between demographic and economic features with internet use in countries during 2001–2017 was investigated. A fixed effects regression model using income level group, regional group, and year as identifiers was employed to study the association between the type of demographic dividend, access to electricity, gross domestic product, inflation, and foreign direct investment and internet use. Robustness checks were also carried out using the static generalized method of moment between the type of demographic dividend and instrument variables (crude death rate, population density, and crude birth rate) in the first stage regression and between the type of demographic dividend, access to electricity, gross domestic product, inflation, and foreign direct investment and internet use in the second stage regression.

The results of this study confirms the previous studies on the nexus between demographic and economic features with internet use (e.g. Filippova and Turutina (2015); Sharma et al. (2015); Baumann et al. (2017); Pradhan et al. (2017); Scheerder et al. (2017); Wang et al. (2019); Singh et al. (2020); Bianchini et al. (2021); Myovella et al. (2021); Yesuf (2021)). It was found that internet use was higher in countries from late- and post-demographic dividend type. Meanwhile, access to electricity, economic growth, and foreign direct investment had a positive association with internet use and inflation was negatively associated with internet use.

Therefore, it is recommended that in order to boost up internet use, which is essential for better development achievement, government of countries, in particular countries in the pre- and early-demographic dividend type, should manage its demographic features to the more favorable ones, i.e. lower fertility and mortality. In addition, the window of opportunity due to the decline of fertility and mortality should be capitalized in order to reap the demographic dividend of economic growth and family welfare acceleration by improving access to quality health, education, and employment opportunity. Regarding economic features, in order to

foster internet use, government of countries should improve access to electricity, raise economic growth, reduce inflation, and enhance foreign direct investment.

**Limitations**

A limitation of this study is that the demographic dividend type was a time invariant variable, while other variables were time variant. However, this limitation should not significantly affect the findings and this study still provides an essential contribution to the study of internet usage. So, it is suggested that further research on the determinants of internet usage should employ time variant demographic change variable.

5. The results of this study confirms the previous studies on the nexus between demographic change and economic features with internet use. Countries from post-demographic dividend typology with better access to electricity, higher economic growth, lower inflation, and higher foreign direct investment had higher internet use. Therefore, it is recommended that in order to boost-up internet use, which is essential for better development achievement, government of countries should manage its demographic change, increase access to electricity, improve economic growth, reduce inflation, and enhance foreign direct investment.

## The Demographic and Economic Features: The Nexus with Internet Use

--Manuscript Draft--

<b>Manuscript Number:</b>	HELIYON-D-21-11053R3
<b>Article Type:</b>	Original Research Article
<b>Section/Category:</b>	Social Sciences
<b>Keywords:</b>	Demographic dividend type; economic determinants; internet use; fixed effects
<b>Manuscript Classifications:</b>	140: Social Sciences
<b>Corresponding Author:</b>	Wilson Rajagukguk, Ph.D. Universitas Kristen Indonesia Jakarta Timur, Jakarta INDONESIA
<b>First Author:</b>	Wilson Rajagukguk, Ph.D.
<b>Order of Authors:</b>	Wilson Rajagukguk, Ph.D.
<b>Abstract:</b>	<p>The goal of this study was to examine the nexus between demographic dividend type and economic features with internet use. The data source was from the World Development Indicator of the World Bank. The unit analysis was country. The panel data analysis method were used for the examination, employing fixed effects regression models using country income level, country regional group, and year as identifiers. The random effects regression model, pooled least square model, and static generalized method of moments were utilized for robustness checks. The dependent variable was the percentage of population using the internet. The independent variables consisted of demographic and economic variables. The demographic variable was the demographic dividend type, while the economic variables were access to electricity, GDP, inflation rate, and foreign direct investment. The results of fixed effects regression indicate that after controlling for the economic features, higher internet use in a country was associated with late- and post-demographic dividend type. Higher internet use was also associated with higher access to electricity, higher GDP, lower inflation rate, and higher foreign direct investment inflow. Robustness checks using random-effects and pooled least square models, using fixed-effects regression model by country income level, using two-stage least square, and using second stage regression by G20 and non-G20 country group division and year, similarly gave consistent results. The association of internet use with the demographic and economic features may imply that population-based and economic development program should be enhanced toward the favorable ones that increase internet usage among the population.</p>

Title: The Demographic Change and Economic Features: The Nexus with Internet Use

Journal: Heliyon

Dear Wilson,

Thank you for submitting your manuscript to Heliyon. We have completed the review of your manuscript and a summary is appended below. The reviewers recommend major revisions are required before publication can be considered. If you are able to address all reviewer comments in full, I invite you to resubmit your manuscript. We ask that you respond to each reviewer comment by either outlining how the criticism was addressed in the revised manuscript or by providing a rebuttal to the criticism.

This should be carried out in a point-by-point fashion as illustrated here: <https://www.cell.com/heliyon/guide-for-authors#Revisions>.

To allow the editors and reviewers to easily assess your revised manuscript, we also ask that you upload a version of your manuscript highlighting any revisions made. You may wish to use Microsoft Word's Track Changes tool or, for LaTeX files, the latexdiff Perl script (<https://ctan.org/pkg/latexdiff>). To submit your revised manuscript, please log in as an author at <https://www.editorialmanager.com/heliyon/>, and navigate to the "Submissions Needing Revision" folder.

Your revision due date is May 24, 2022. We understand that the COVID-19 pandemic may well be causing disruption for you and your colleagues. If that is the case for you and it has an impact on your

ability to make revisions to address the concerns that came up in the review process, please reach out to us. I look forward to receiving your revised manuscript.

Kind regards,

Romanus Osabohien

Associate Editor - Business & Economics

Heliyon

Editor and Reviewer comments:

Reviewer 3: Methods:

Author did not discuss the countries of study and their regions rationale for selecting them need to be explained.

Author: Thank you very much for the comments. A table of list of countries of the study has been added in Appendix Table A. The discussion about the countries also has been added in line 329–334.

Reviewer 1 asked, "Are you use the test on series of log return series or original series? Clarify?"

Author did not understand this question, therefore did not give appropriate response.

The question is, Did you use the original data as it is or you transformed the data using natural log?

Author: Thank you very much for the comments. The Author used the original data for all variables, except for GDP where natural log was used as explained in the models in line 282–283 and 297–303.

Reviewer 1 commented that, "The paper lacks a clear justification of the variables used in the empirical section and should include updated/recent literature.

Author: Thank you very much for the comments.

As stated in Section 1 (Introduction) that there was a significant inequality in access to the internet across countries in the world.

The Author was interested to study the factors of this inequality in the internet use with a hope that it will contribute to the understanding of the determinants of internet use as well as to improve access to the internet use as a part of sustainable development goals (SDGs).

Author did not understand this question, therefore did not give appropriate response,

The question is, why did you decided to use variables like; information technology, typology of pre-, early- (EarlyDD), late- (LateDD), and postdemographic dividend (PostDD) with pre-demographic dividend typology as the reference category. The economic variables, access to electricity, gross domestic product, inflation, consumer prices and foreign direct investment net inflows.

Author: Thank you very much for the comments.

The Author chose the demographic and economic features as the independent variables. Demographic dividend type was selected as demographic feature, while access to electricity, GDP, inflation, and FDI as economic features. The types of demographic dividend were based

on Ahmed et al. (2016) in line 89–103 and the availability of the data from the World Bank.

Study on the role of demographic change on development, including access to information and communication technology was limited. Therefore, the Author chose this variable as the independent variable. The selection of electricity, GDP, inflation, and FDI as economic features was based on the literature review and availability of data.

Results:

Interpretation:

Up till now the conclusion is not well written. Authors(s) should follow this format for conclusion writing.

(i) brief background, (ii) key findings, (iii) their implications, and (iii) suggestions/recommendation

Author: Thank you very much for the comments. The Conclusion has been revised as in line 506–533.

Other comments:

One of the reviewer comment is:

(1) The introductory section is meant to introduce the study, the gap and set pace for the remaining sections.

Author: Thank you very much for the comments. The gap and pace for remaining sections have been added, respectively in line 115–118 and 127–129.

(2) This section has failed to link the three key variables, demographic change, economic features and internet usage.

Author: Thank you very much for the comments. This study focused on (1) the association between demographic change and internet and (2) the association between economic features and internet. The links of these variables have been added in line 79 – 87.

Author(s) did not introduce any gap or set pace for the remaining section,

To introduce gap in a research work, author(s) need to start with a sentence like this, "A summary of the reviewed literature revealed that no study on .... had been carried out using ..... in order to address the gap indicated above this study sought to determine the ... "

To set pace for the remaining section, author(s) should provide a statement like this, "the remainder of the paper is organized as follows. In section 2.0, Data and Method was presented, section three provided the ... e.t.c.

Author: Thank you very much for the suggestions. The gap and pace for remaining sections have been added, respectively, in line 115–118 and 127–129.

Almost all the reviewers requested for the significance or motivation of this study. This can only be stated if the gaps in existing literature can be clearly highlighted.

Author: Thank you very much for the suggestions. The gap has been added in line 127–129.

Reviewer 4: Methods: The conceptualization and operationalization of this study are problematic. This study has shown a low degree of novelty. No clear problem statement nor research gap is highlighted. No details of data collection.

Author: Thank you very much for the suggestions. The gap has been added in line 115–118.

Results: Therefore, I am not convinced by the findings.

Author: Thank you very much for the suggestions. The findings have been improved by conducting robustness checks in line 426–503.

Interpretation: The interpretation of the findings is rather weak and not rigorous.

Author: Thank you very much for the suggestions. The interpretation of findings has been improved in line 375–492.

Other comments: Need to highlight the theoretical and practical of this study.

Author: Thank you very much for the suggestions. The theoretical and practical of this study have been added in line 121 –125.

Reviewer 5: Methods: The method used is descriptive method using documentary analysis. However, the documents analyzed did not cover countries included in the sample respondents. The analysis of findings would have been more comprehensive and exciting to readers if name of countries were included in the findings.

Author: Thank you very much for the suggestions. The list of countries in the study has been added in Appendix Table A.

Results: The results of the study is comprehensive, however if there is labelling of countries included in the variables it would have more exciting.

Author: Thank you very much for the suggestions. The list of countries in the study has been added in Appendix Table A.

Interpretation: The interpretation based from statistical analysis of the document is comprehensive.

Author: Thank you very much for the comments.

Other comments: Labelling countries in the demographic typology is recommended.

Author: Thank you very much for the suggestions. The list of countries in the study has been added in Appendix Table A.

Reviewer 6: Methods:

Results:

Interpretation:

Other comments:

Reviewer 8: Methods: The methods employed by the author(s) are suitable. However, there is need to first specify the implicit function of

the model before the explicit function. In addition, the specified model is not correctly specified without the subscript 'it'. It looks more like a time series model.

Author: Thank you very much for the comments. The models have been revised in line 282–283 and 297–303.

Results: The results are adequately explained. Although there is a need for theoretical framework to link all parts of the study.

Author: Thank you very much for the comments. Theoretical framework to link all parts of the study have been added in, for example, line 372–373.

Interpretation: The explanation still lacks theoretical basis.

Author: Thank you very much for the comments. Theoretical basis has been added in, line 79–87.

Other comments: The issues raised by the author(s) are important and adequately addressed, but poor grammatical expressions alter the correct discussion of findings in the study. I hereby suggest a thorough editing by an expert in English language writing to edit the manuscript before publication.

Reviewer 9: Methods:

The process of subject selection was clear.

The variables were defined and measured appropriately.

The study methods were valid and reliable.

There is enough detail to replicate the study.

Author: Thank you very much for the comments.

Results:

The text in the results added to the data.

A statistically significant result was clear.

A practically meaningful result was clear.

Interpretation:

was clear

Author: Thank you very much for the comments.

Other comments:

Reviewer 10: Methods: clear enough; it needs more appropriate reasoning in choosing GMM estimator.

Author: Thank you very much for the comments. Reasoning in choosing GMM estimator has been addressed in line 285–290.

Results: clear enough

Author: Thank you very much for the comments.

Interpretation: Still using the old references for justifying the findings.

Author: Thank you very much for the comments. Recent references for justifying the findings have been added in line 79–87.

Other comments:

Data in Brief (optional):

We invite you to convert your supplementary data (or a part of it) into an additional journal publication in Data in Brief, a multi-disciplinary open access journal. Data in Brief articles are a fantastic way to describe supplementary data and associated metadata, or full raw datasets deposited in an external repository, which are otherwise unnoticed. A Data in Brief article (which will be reviewed, formatted, indexed, and given a DOI) will make your data easier to find, reproduce, and cite.

You can submit to **Data in Brief** when you upload your revised manuscript. To do so, complete the template and follow the co-submission instructions found here: [www.elsevier.com/dib-template](http://www.elsevier.com/dib-template). If your manuscript is accepted, your Data in Brief submission will automatically be transferred to Data in Brief for editorial review and publication.

Please note: an open access Article Publication Charge (APC) is payable by the author or research funder to cover the costs associated with publication in Data in Brief and ensure your data article is immediately and permanently free to access by all. For the current APC see: [www.elsevier.com/journals/data-in-brief/2352-3409/open-access-journal](http://www.elsevier.com/journals/data-in-brief/2352-3409/open-access-journal)

**MANUSCRIPT TITLE:** The Demographic Change and Economic Features: The Nexus with Internet Use

**MANUSCRIPT NUMBER:** HELIYON-D-21-11053

<b>General Comment</b>	<p>(1) I WASN'T PART OF THE ORIGINAL REVIEWER OF THIS MANUSCRIPT</p> <p>(2) MOST OF THE COMMENTS BY THE ORIGINAL REVIEWERS (ESPECIALLY REVIEWER II) WAS NOT EFFECTED BY THE AUTHOR(S)</p>	Author	Note Line
<b>Title</b>			
<b>Abstract</b>			
<b>1. Introduction</b>	<p>One of the reviewer comment is:</p> <p>(1) The introductory section is meant to introduce the study, the gap and set pace for the remaining sections.</p> <p>(2) This section has failed to link the three key variables, demographic change, economic features and internet usage.</p> <p>Author(s) did not introduce any gap or set pace for the remaining section, To introduce gap in a research work, author(s) need to start with a sentence like this, "A summary of the reviewed literature revealed that no study on .... had been carried out using ..... in order to address the gap indicated above this study sought to determine the ..."</p>	<p>Thank you for the comments.</p> <p>Research gap has been added.</p>	105–108

	<p>To set pace for the remaining section, author(s) should provide a statement like this, “the remainder of the paper is organized as follows. In section 2.0, Data and Method was presented, section three provided the ... e.t.c.</p> <p>Almost all the reviewers requested for the significance or motivation of this study. This can only be stated if the gaps in existing literature can be clearly highlighted.</p>	<p>The statement has been added.</p> <p>Research gap has been added.</p>	<p>113–115</p> <p>105–108</p>
<b>2. Literature Review</b>			
<b>3. Data and Method</b>	<p>Author did not discuss the countries of study and their regions rationale for selecting them need to be explained:</p> <p>Reviewer 1 asked, “Are you use the test on series of log return series or original series? Clarify?”</p> <p>Author did not understand this question, therefore did not give appropriate response.</p> <p>The question is, Did you use the original data as it is or you transformed the data using natural log?</p> <p>Reviewer 1 commented that, “The paper lacks a clear justification of the variables used in the empirical section and should include updated/recent literature.</p>	<p>Thank you for the comments.</p> <p>The list of countries in the study by demographic dividend type has been added in Appendix Table 1.</p> <p>The author used original series.</p> <p>The justification of the variables used was provided in Section 2 (Literature Review)</p>	

	<p>Author did not understand this question, therefore did not give appropriate response,  The question is, why did you decided to use variables like; information technology, typology of pre-, early- (<i>EarlyDD</i>), late- (<i>LateDD</i>), and postdemographic dividend (<i>PostDD</i>) with pre-demographic dividend typology as the reference category. The economic variables, access to electricity, gross domestic product, inflation, consumer prices and foreign direct investment net inflows.</p>	<p>As stated in Section 1 (Introduction) that there was a significant inequality in access to the internet across countries in the world.</p> <p>The Author was interested to study the factors of this inequality in the internet use with a hope that it will contribute to the understanding of the determinants of internet use as well as to improve access to the internet use as a part of sustainable development goals (SDGs).</p> <p>The Author chose the demographic and economic features as the independent variables. Demographic dividend type was selected as demographic feature, while access to electricity, GDP, inflation, and FDI as economic features. The types of demographic dividend were based on Ahmed et al. (2016) in line 82–96 and the availability of the data from the World Bank.</p> <p>Study on the role of demographic change on development, including access to</p>	
--	---	--	--

		information and communication technology was limited. Therefore, the Author chose this variable as the independent variable. The selection of electricity, GDP, inflation, and FDI as economic features was based on the literature review and availability of data.	
<b>4. Results and Discussion</b>			
<b>6. Conclusion and Recommendation</b>	Up till now the conclusion is not well written. Authors(s) should follow this format for conclusion writing. (i) brief background, (ii) key findings, (iii) their implications, and (iii) suggestions/recommendation	Thank you for the suggestions.  Conclusion has been revised.	487–514

Formatted: Numbering: Continuous

## Abstract

The goal of this study was to examine the nexus between demographic ~~change~~ ~~dividend type~~ and economic features with internet use. The data source was from the World Development Indicator of the World Bank. ~~The unit analysis was country. The Ppanel data analysis methods~~ were used for the examination, employing fixed effects regression ~~models using country income level, country regional group, and year as identifiers, random effects regression, and pooled least square models. The unit analysis was country.~~ The ~~random effects regression model, pooled least square model, and static~~ generalized method of moments ~~and two stage least square~~ were utilized ~~as for the~~ robustness checks. The dependent variable was the percentage of population using the internet. The independent variables consisted of demographic and economic variables. The demographic variable was the demographic dividend typology, while the economic variables were access to electricity, GDP, inflation rate, and foreign direct investment. The results of fixed effects regression indicate that ~~using country income level, country regional group, and year as identifiers and~~ after controlling for the economic features, higher internet use in a country was associated with late- and post-demographic dividend ~~typology~~ type. Higher internet use was also associated with higher access to electricity, higher GDP, lower inflation rate, and higher foreign direct investment inflow. ~~The~~ Robustness checks using random-effects and pooled least square models, using fixed-effects model by country income level, using two-stage least square, and using second stage regression by G20 and non-G20 country group division ~~and year~~, similarly gave consistent results. ~~The association of internet use with the demographic and economic features may imply that population-based and economic development program should be enhanced toward the favorable ones that increase internet usage among the population.~~

Key words: Demographic dividend typology, economic determinants, internet use, fixed effects.

## 1. Introduction

The world is marked by a considerable inequality in human development achievement. The United Nations Development Programme (UNDP) reported that in 2019 the human development index (HDI) varied greatly from a lowest of 0.394 in Niger to a highest of 0.957 in Norway (UNDP, 2020). This disparity could be attributed to the inequity in access to digital technology, including broadband internet.

Widespread access to broadband internet is a key driver of human development. Improving access to the internet is also identified as an instrument to achieve the Sustainable Development Goals (SDGs) in goal 4 (Quality education), goal 9 (Industry, innovation, and infrastructure), and goal 17 (Partnership for the Goals). Internet allows people to be connected, work, shop, and study especially during the COVID-19 pandemic lockdowns (United Nations, 2021).

Internet can be used as an instrument to develop an economy and to pursue a more developed economy. Adelere and Itasanmi (2016) argued that internet increases the participation and motivates illiteracy alleviation. Internet is also an effective means in adult literacy program. Further, study by Kouton (2019) found that the use of internet reduced energy demand used for heating and transportation. This saving allowed the government to allocate energy generator budget to other sectors.

The World Bank (2022) estimated that increasing internet penetration from 35% to 75% of the population in all developing countries could increase about US\$2 trillion to their joined gross domestic product and generate more than 140 million works around the world. However, there were a great inequality in the internet access across the world.

Formatted: Font color: Text 1

The World Bank (2021) reported that in 2019, among 174 countries in the world where the data was available, this access varied greatly across countries, lowest in Burundi (5.2%) and almost universal in Bahrain (99.7%).

Information and communication technology (ICT), in particular internet, is a most developed business and business product in this century. The study of ICT encounters economists and demographers with two sides, as consumers and producers. As it can be seen from Figure 1, there was a rapid increase of internet consumers in the world. The percentage of internet users in the world from 1990–2018 increased from 0% in 1990 to 51% in 2018 only in 28 years. The time trends of the percentage of internet users was not the linear one, but the power one. Therefore, the internet business is a promising one.

~~Improving access to the internet is also identified as an instrument to achieve the Sustainable Development Goals (SDGs) in goal 4 (Quality education), goal 9 (Industry, innovation, and infrastructure), and goal 17 (Partnership for the Goals). Internet allows people to be connected, work, shop, and study especially during the COVID-19 pandemic lockdowns (United Nations 21). However, there were a great inequality in the internet access across the world.~~

**Figure 1**  
**Individuals Using the Internet (% of population): World 1990-2018**

On the other hand, decline in fertility and mortality level and change in migration patterns have caused countries to experience demographic change that has been related to demographic dividend. Demographic dividend is economic growth as the results of changes in age structure in a country due to the decline in family size and longer life that cause increase in the percentage of productive age population aged 15–64 years old. As a result, lower investment is needed for young population aged 0–14 years old. At the same time, productive age population increases that open the window of opportunity to accelerate economic growth and family welfare. At micro level, this demographic transition can result in family living standard improvement and higher income. At macro level, demographic transition can affect economic development in a country.

It is proposed that demographic change can have a positive contribution to development (e.g. Ahmed et al. 2016), including economic and information and communication technology development. Demographic change of fertility and mortality decline could help create a period

of sustainable economic growth as happened in some East Asian economies (e.g. Bloom et al., 2020; Amornkitvikai, Y. et al., 2022, Hosan et al., 2022, Liu and McKibbin, 2022). The mechanism of growth that is the policy area is through public health, family planning, economic policy that promote labor market flexibility, trade openness, and saving. The government of countries has window of opportunity to capitalize productive age population to reap the demographic dividend of economic growth and family welfare acceleration. This economic growth then enables countries to enlarge their heavily internet-based economies and consequently rises internet usage (Pradhan et al., 2017; Anuj, et al. 2018; Amaluddin 2020).

Bonus demografi adalah pertumbuhan ekonomi yang merupakan hasil dari perubahan struktur umur sebuah negara, perubahan dari sebuah keluarga yang besar berumur pendek menjadi keluarga kecil dan berumur berumur lebih panjang.

Formatted: Font: (Default) Times New Roman, Not Highlight

Formatted: Font: (Default) Times New Roman

Formatted: Line spacing: 1.5 lines

Karena perubahan dalam distribusi umur, diperlukan investasi yang lebih sedikit untuk membangun penduduk kelompok usia mudda dan kemudian sumberdaya yang lebih besar digunakan untuk pembangunan (economic gift). Berbarengan dengan hal tersebut, Angkatan kerja bertumbuh lebih cepat (more rapidly) dibandingkan dengan penduduk yang tergantung padanya menciptakan sebuah jendela kesempatan percepatan pertumbuhan ekonomi dan kesejahteraan keluarga. Dalam skala mikro, transisi ini dapat berbuah dalam perbaikan standar hidup keluarga dan pendapatan yang lebih tinggi. Dalam tingkat makro hal ini dapat mempengaruhi perkembangan ekonomi sebuah negara.

-Ahmed et al. (2016) grouped countries into four demographic dividend typology-type based on the demographic change and economic development achievement. The demographic dividend typology is classified as the pre-, early-, late-, and post-demographic dividend. Countries with a fertility level above four children per woman, increasing percentage of working age population (15–64 years), and low income level are categorized as the pre-demographic dividend countries. Meanwhile, countries with a fertility level between 2.1 and four children per woman, increasing percentage of working age population, and low-middle and middle-high income level are categorized as the early-demographic dividend countries. Further, countries with a fertility level below 2.1 children per woman, increasing percentage of working age population, and high income level are also categorized as the early-demographic

dividend countries. Furthermore, countries with a fertility level between 2.1 children and four per woman, declining percentage of working age population, and low, low-middle, and middle-high income level are categorized as the late-demographic dividend countries. Lastly, countries with a fertility level below 2.1 children per woman, decreasing percentage of working age population, and high income level are categorized as the post-demographic dividend countries.

~~It is proposed that demographic change can have a positive contribution to development (e.g. Ahmed et al. 2016), including information and communication technology development. As it can be seen from Figure 2, there was a significant difference in the percentage of internet users and its trends across the demographic dividend typologies. The percentage of internet users was consistently highest in the post-demographic dividend countries, followed by in the late- and early-demographic dividend countries, and lowest in the pre-demographic dividend countries. It also can be seen that during 1990–2018 the percentage of internet users during 1990–2018 increased more rapidly in more developed countries, the post-demographic dividend typology countries.~~

~~The determinants of internet use have been proposed (e.g. Scheerder et al. 2017). These include demographic and socioeconomic factors. The association between demographic and economic features and information and communication technology has also been studied (e.g. Bianchini et al. 2021; Yesuf, 2021; Singh et al. 2020; Baumann et al. 2017). However, a summary of the reviewed literature revealed that no study on demographic dividend type and internet use had been carried out. In order to address the gap indicated above, in general this study sought to~~

standar hidup keluarga dan pendapatan yang lebih tinggi. Dalam tingkat makro hal ini dapat mempengaruhi perkembangan ekonomi sebuah negara.

Espinoza Bianchini, G., Navia, P., & Ulriksen Lira, C. (2021) melakukan studi tentang dampak umur, identifikasi ideological pada pemakaian jaringan sosial on line untuk mendapatkan informasi politik. Indikator sosio-demographic dan indentifikasi ideologikal, akses serta pemakaaian jaringan sosial ditemukan mempengaruhi keterlibatan demokratik. Di negara-negara di mana digital divide (akses ke internet) dan digital inequality (penggunaan internet) terjadi berdampingan (Coexist), dampak indikator sosio-demografis lebih kuat, karena mereka yang memiliki lebih sedikit alat dan sumber daya mepunyai lebih sedikit akses dan lebih sedikit menggunakan jejaring sosial. untuk keterlibatan demokratis.

Yesuf, K. A. (2021) melakukan studi untuk menginvestigasi determinan sosiodemographic internet dan dampaknya pada perilaku keluarga berencana diantara laki laki muda (young male) di Ethiopia menggunakan data dari Ethiopia health and demographic survey 2016. Besarnya penggunaan internet di Ethiopia (magnitude of internet use) sebesar 14% berasosiasi dengan dengan pemakaian internet adalah umur 20-24 tahun, tingkat Pendidikan yang tinggi, hidup pada region kota administrative, menggunakan mobile phone, responden yang dapat membaca seluruh kalimat, dan responden yang mempunyai computer dirumah. Responden dengan pekerjaan di sector pertanian dan pekerja manual kurang cenderung menggunakan internet.

Singh, S., Sahni, M. M., & Kovid, R. K. (2020). Melakukan studi bahwa kegunaan yang dirasakan (Perceived usefulness) dan Pengaruh social (social influence) merupakan determinan

kunci niat perilaku menggunakan layanan Fintech. Selanjutnya ditemukan bahwa digital behavior serta karakteristik demografi (umur dan gender) memperkuat hubungan tersebut

Filippova, I., & Turutina, E. (2015) menggunakan sampel yang merupakan representasi seluruh penduduk Rusia melakukan studi mengukur secara empiris penggunaan internet dalam proses Pendidikan di Rusia. Perbedaan umur dan gender, finansial status, dan tingkat Pendidikan merupakan determinan penggunaan internet untuk tujuan pendidikan.

Online health information seeking behavior (OHISB) is currently a widespread and common behavior that has been described as an important prerequisite of empowerment and health literacy. Baumann, E., Czerwinski, F., & Reifegerste, D. (2017). Ditemukan bahwa factor demografi seperti status sosio ekonomi, umur, gender merupakan determinan penting untuk OHISB. Wang, J., Xiu, G., & Shahzad, F. (2019) selain faktor kunci untuk OHISB seperti self-efficacy, Internet experience, and perceived ease of use, membagi determinan OHISB ke dalam empat kategori yakni demographic characteristic factors, cognitive factors, internal factors, and external factors.

Sharma, S. K., Govindaluri, S. M., & al Balushi, S. M. (2015) melakukan riset mengeksplorasi determinan utama dari pemakai internet banking. Menggunakan Two staged regression ditemukan bawah service quality, trust, perceived usefulness, percieve ease of use, attitude and demographic variabels merupakan dterminan internet banking users.

Pertumbuhan ekonomi dipengaruhi secara signifikan oleh digitalisai dan transisi demographi (Zaman, K. A. U. and T. Sarker., 2021). Menggunakan Bangladesh sebagai sebuah case study, Zaman dn Sarker mengadopsi model three stage least square menganalisis bagaimana digitalisasi, dan transisi demographi mempercepat pertumbuhan ekonomi di Bangladesh.

Setiap kenaikan 1% jumlah pengguna internet, GDP akan meningkat sebesar 0,11%, ceteris paribus. Sementara itu setiap penurunan 10 basis poin dalam dependency ratio akan meningkatkan GDP sebesar 1,2%. Faktor kunci untuk digitalisasi adalah labor participation rate, produktivitas pekerja, dan mobil penetration. Urbanisasi secara bolak-balik mempengaruhi peningkatan pemakai internet. Skor Human Development Index (HDI) dan angka urbanisasi secara negative signifikan berpengaruh pada angka ketergantungan, sementara itu partisipasi perempuan dalam Angkatan kerja mempunyai pengaruh positif.

Zaman, K. A. U. and T. Sarker. 2021. Demographic Dividend, Digital Innovation, and Economic Growth: Bangladesh Experience. ADBI Working Paper 1237. Tokyo: Asian Development Bank Institute. Available: <https://www.adb.org/publications/demographicdividend-digital-innovation-economic-growth-bangladesh>

Bonus demografi memainkan peran penting sehubungan dengan hampir 850 Juta pelanggan langganan seluler (4 kali penetrasi Internet yang mencapai sekitar 205 Juta) di India (Burrage, V.,2017). Pasca liberisasi ekonomi India, pengembangan system perbankan mengalami pertumbuhan yang sama dengan penduduk. Sering dengan pertumbuhan penduduk, permintaan dan tantangan juga meningkat dalam perkembangan system perbankan dan pembayaran. Untuk mengangani permasalahan ini pemerintah India mendisain sangat banyak strategi untuk meningkatkan ekonomi massa di India. Pemerintah India memulai program inklusi keiangan untuk mendapatkan pertumbuhan yang berkesinambungan melalui isu sosial seperti pengentasan kemiskinan (removing poverty), pendidikan untuk semua, dan well balance society melalui sitem keuangan dapat diperkuat. Seknario ini berbuah banyak (fruitful) karena India mempunyai advantage of demographic advantage, technological advandement, dan financial literacy, penignkatan penetration of Internet technology, dan juga penetration of mobil technology melalui smartphone. Demographic dividdden memainkan sebuah peranan krusial. Hal ini mendorong perkembangan dan sebuah kompetisis yang lebih ketat dalam system pembayaran diluar insituisi.

Myovella, G., Karacuka, M., & Haucap, J. (2021) melakukan studi tentang determinants of digitalization and digital divide in Sub-Saharan African economies. Hasil temuannya adalah bahwa GDP per capita, gross capital formation, political stability, regulatory efficacy and electricity infrastructure secara langsung mempengaruhi digital divide. Juga ditemukan bahwa GDP per capita, population growth, government consumption, trade openness, and electricity infrastructure secara tidak langsung mempengaruhi digital divide melalui efek spillover (spillover effects)

Pertanian merupakan sebuah sector kunci dalam mendorong pertumbuhan ekonomi dan pengentasan kemiskinan di Vietnam (Giang, M. H., Xuan, T. D., Trung, B. H., & Que, M. T., 2019). Produktivitas diukur sebagai Total Factor Productivity. Determinan dari TFT di Vietnam termasuk size and age, share of state and foreign ownership, export, accessibility to Internet and bank loan of firms.

Inovasi dan kewirausahaan merupakan factor pendorong penting untuk pertumbuhan ekonomi, dan internet memainkan sebuah peranan penting dalam aktivitas kewirausahaan. Menggunakan dataset dari China Family Panel Studies (CFPS) dataset in 2014 and 2016, Tan, Y., & Li, X. (2022) melakukan studi dan menemukan bahwa internet mempunyai pengaruh signifikan dan positif pada kewirausahaan di China. Juga ditemukan bahwa internet mendorong (promote) kewirausahaan dan menolong pengusaha memperoleh pendanaan informal.

**Formatted:** Font color: Text 1

Pemakaian luas mobile phot dan pertumbuhan penetrasi internet telah menciptakan sebuah kesempatan unit untuk meningkatkan pelayanan keuangan. Perusaaann Financial Technology (FinTech) dan mobile banking (m-banking) membedakan konsumen menggunakan platform digital menggunakan jasa finansial tanpa dipelukan akses fisik sebagaimana yang terjadi pada bank tradisional (Slazus, B. J., & Bick, G., 2022). Pertumbuhan FinTech berdampak pada pertumbuhan ekonomi keluarga dan sebuah bangsa.

Teknologi ingernet telah memecahkan batas-batas ruang geographical tradisional, mempersingkat jarak tempuh antar wilayah, memaksimalkan integrasi berbagai sumberdaya. Dalam era teknologo digital, perkembangan jaringan internet yang cepat, dapat menghemat pemakaian dan konsumsi energi (Ren, S., Hao, Y., Xu, L., Wu, H., & Ba, N., 2021). terjadi hhubungan negatif antara pengebangan internet dengan struktur konsumsi energi melalui pertumbuhan ekonomi, investasi R&D, human capital, financial development dan struktur industrial di China.

Wu, S., Wang, P., & Sun, B. (2022) menggunakan city level data from China for the period 2003-15 menemukan bahwa internet mempengaruhi disparitas ekonomi antar kota di Chian melalui dampak heterogeneous pada pertumbuhan ekonomi. Internet memperlebar disparitas ekonomi antar kota dengan angka penetrasi internet yang rendah dan kota dengan angka penetrasi internet yang tinggid.

Bianchini et al. (2021) studied the impacts of age and ideological identification on the use of online social network to obtain political information. They found that socio-demographic factors had strong impacts on internet use. Meanwhile, a study in Ethiopia by Yesuf (2021) found higher internet use among those who were aged 20–24 years, had higher education, lived in urban areas, had a mobile phone, literate, had a personal computer, and worked in formal sectors. Further, a study by Singh et al. (2020) found that perceived usefulness and social influence were the key determinants of the use of Fintech services. They also found that age and gender also influenced this behaviour.

The importance of demographic and socioeconomic factors on internet use for health purposes were also found. Studies by Baumann et al. (2017) and Wang et al. (2019) found age, gender, and socioeconomic factors were important determinants of online health information-seeking behaviour.

Studies also found the significance of demographic and socioeconomic determinants in internet use for financial purposes. A study in Russia by Filippova and Turutina (2015) found that age, gender, financial status, and education level were the determinants of internet use for education

purposes. Meanwhile, Sharma et al. (2015) found the importance of demographic variables in internet use for banking purposes.

A study by Burragoni (2017) found that demographic dividend played an important role in 850 million cellular subscriptions in India. In the post-economic liberalization, banking system development grew together with the population. Together with economic growth, demand and challenges in banking and payment system development also grew.

Myovella et al. (2021) studied the effects of demographic and economic features on digitalization and digital divide in Sub-Saharan African economies. They found that GDP per capita, gross capital formation, trade openness, population growth, and electricity infrastructure influenced digital divide. Meanwhile, low internet use was found related to low economic, social, and cultural development. A study in Yaman by Isaac et al. (2018) found that low internet use was associated with low economic, social, and cultural development. Another study in Indonesia also found the importance of access to electricity in internet use (Amaluddin,-2020).

Mungkin salah satu pertanyaan dan yang menyita banyak perhatian dalam literatur ekonomi adalah : mengapa sejumlah negara lebih kaya dibandingkan dengan negara lain” (Solow, 1956). Solow suggested bahwa perbedaan dalam angka pertumbuhan pada akumulasi kapital dapat mengakibatkan perbedaan dalam output per kapital. Selanjutnya Lucas (1988), disparitas dalam human capital merupakan central role dalam analisis pertumbuhan dan perkembangan. Selanjutnya Klenow dan Rodriguez-Clare (1997), Hall and Jones (1999), Parente dan Prescott (2000) dan kemudian Bils dan Klenow (2000) berargumen bahwa perbedaan output per pekerja tidak diakibatkan oleh perbedaan dalam human capital (atau physical capital) tetapi oleh perbedaan dalam sebuah residual yang dinamakan Total Factor Productivity (TFP)

Total factor productivity (TFP) kemudian merupakan sebuah ukuran produktivitas dihitung dengan membagi total produksi dengan rata-rata tertimbang dari input, yakni tenaga labor dan capital. Human capital diperkaya dengan internet dan internet merupakan physical capital yang sangat berkembang pada revolusi Industri 4.0.

Pertumbuhan internet nampaknya memainkan peran yang lebih penting dalam meningkatkan produktivitas faktor hijau di Cina (Li, T., Han, D., Ding, Y., & Shi, Z.,2020). Green Total Factor Productivity merupakan pilihan yang tak terelakkan untuk secara berkesinambungan meningkatkan kualitas ekonomi China, dan juga promote global development. Sejumlah factor seperti Internet development, human capital, urbanization, energy efficiency, and external dependence all exert a positive influence on China's green total factor productivity

Formatted: Line spacing: 1.5 lines

Song, Y., & Liu, H. (2020) menunjukkan bahwa internet memperbaiki TFP di sejumlah pelabuhan Sungai Yangtze. Juga ditemukan bahwa pengembangan internet pada area dengan tingkat perkembangan ekonomi yang lebih rendah memperbaiki TFP. Pengembangan internet relevan untuk pembangunan ekonomi.

Formatted: Justified, Line spacing: 1.5 lines, Don't hyphenate

Zelenyuk, V. (2014) mengembangkan sebuah kerangka kerja menguji dan mendapat signifikansi dari dampak teknologi informasi dan komunikasi pada distribusi produktivitas tenaga kerja pada negara berkembang pada tahun 1980-1995. Internet of Things (IoT) merupakan sebuah innovational complemetary pada ICT dan berimplikasi pada pertumbuhan Total Factor Productivity (Edquist, H., Goodridge, P., & Haskel, J.,2021).

Formatted: Not Highlight

Jika internet merupakan factor pertumbuhan ekonomi, maka studi ini mempelajari factor faktor yang mempengaruhi pertumbuhan dan pemakaian internet.

Source: World Bank (2021) (Author's compilation).

**Figure 2**

**Individuals Using the Internet (% of population) by the Demographic Dividend Typology**

Internet can be used as an instrument to develop an economy and to pursue a more developed economy. Adelere and Itasanmi (2016) argued that internet increases the participation and motivates illiteracy alleviation. Internet is also an effective means in adult literacy program. Further, study by Kouton (2019) found that the use of internet reduced energy demand used for heating and transportation. This saving allowed the government to allocate energy generator budget to other sectors.

The use of internet and access to digital devices are continuously increasing in all parts of the world (Horn & Rennie 2018). For example, in Sarawak in Borneo island, Malaysia, a number of remote villages were lack of infrastructure, such as asphalt road and electricity network. But, a number of people had a mobile phone and internet access.

Salahuddin and Alam (2015) studied the association between the internet usage, electricity consumption, and economic growth in Australia. They found that bidirectional causal link

10  
11 ~~46~~  
12 ~~47~~ Stork et al. (2013) analyzed internet access and use trends in some African countries in  
13 ~~48~~ 2007/2008 and 2011/2012. They found that the use of internet increased very significantly in  
14 ~~49~~ these countries despite of some barriers, such as large-scale computers and expensive  
15 ~~50~~ connectivity costs. In addition, mobile phone had been used as key entry point to internet use.  
16 ~~51~~ As a result, the internet penetration increased by 11.5% in these countries from 2007/2008 to  
17 ~~52~~ 2011/2012.  
18  
19

20 ~~53~~  
21 ~~54~~ Meanwhile, Nigeria experienced economic growth as an impact of ICT business and  
22 ~~55~~ telecommunication liberalization during the 2000s (Akinwale et al. 2018). There was a co-  
23 ~~56~~ integration between ICT and economic growth in the long run. In the short run, only with secure  
24 ~~57~~ internet server per 1 million and mobile cellular subscription per 100 people resulted in positive  
25 ~~58~~ and significant impact on economic growth.  
26  
27

28 ~~59~~  
29 ~~60~~ Gholizadeh et al. (2014) studied the relationship between gross domestic product (GDP) and  
30 ~~61~~ internet use in some ASEAN countries during 1996–2011. They found that there was a positive  
31 ~~62~~ and significant association between internet use and GDP, although there were differences  
32 ~~63~~ between those ASEAN countries. Meanwhile, a study by Bahrini & Qaffas (2019) in the  
33 ~~64~~ Middle East and North Africa (MENA) and Sub-saharan Africa (SSA) found that ICT, i.e.  
34 ~~65~~ mobile phone, internet usage, and broadband adoption were the main driver of economic  
35 ~~66~~ growth during 2007–2016.  
36  
37  
38

39 ~~67~~  
40 ~~68~~ Internet fosters economic growth (Jiménez et al. 2014). An increase of 10% in internet  
41 ~~69~~ connectivity was found to boost up GDP growth by 1.38% in the world. In OECD countries,  
42 ~~70~~ high internet access generated GDP by 2%.  
43  
44

45 ~~71~~  
46 ~~72~~  
47 ~~73~~ Meanwhile, Salahuddin et al. (2016) studied the effects of internet and real GDP on social  
48 ~~74~~ capital creation measured by trust in Australia during 1985–2013. They found that internet  
49 ~~75~~ increased social capital in the short run, but reduced social capital in the long run. In addition,  
50 ~~76~~ there was a short and long run positive relationship between internet and GDP per capita.

Not only in developing countries that internet affects economic growth. Amiri & Reif (2013) in their study in Nordic region found that in countries with highest internet penetration there was an association between highest internet penetration and highest GDP per capita in the world.

Internet penetration is determined by a number of factors. Feng (2015) studied the factors influencing internet penetration in China. It was found that internet penetration was mainly affected by internet access cost, internet content, and GDP per capita.

Meanwhile, a study by Lera-López et al. (2011) found that socioeconomic, demographic, and regional factors influenced internet use. The use of internet was primarily associated with education, age, occupation, employment in service sector, nationality, living in urban areas, and regional GDP per capita. They also found that internet use was positively related with broadband connection and education, while internet skill was influenced by gender and population size.

The relationship between inflation and internet use has also been studied. Yi & Choi (2005) found that internet improved productivity and reduced inflation. An increase of 1% in the ratio of the internet users to total population reduced inflation from 0.04264% point to 0.13193% point. Subsequently, inflation has a positive effect on internet demand.

The new economic theory proposed that humankind is entering an era with high output growth, low unemployment, and low inflation (Meijers, 2006). It is described that inflation suppresses internet growth and on the other side, internet will increase inflation in the long run. Sharma et al. (2014) studied the relationship between inflation and internet use through online shopping in India. They found that inflation had an indirect effect on internet growth.

Choi (2003) investigated the effects of internet on the volume of inward foreign direct investment (FDI). Internet was assumed to boost up higher FDI through productivity improvement. Using 53 FDI recipient country data and FDI gravity equation it was found that when the number of hosts and internet users in a country increased by 10%, FDI inflow increased by more than 2%.

1  
2  
3  
4  
5  
6  
7 11 The international community supports developing countries by building up digital  
8  
9 12 infrastructure and regulation in order to be able to participate in international trade, in particular  
10 13 through larger diversification series in export. The study by Gnanngnon (2020) using panel data  
11 14 from 131 countries during 1995–2014 found that greater internet access was positively  
12 15 associated with export diversification in particular both in less developed and developed  
13 16 countries. Internet access creates innovation level of a country, merchandise export including  
14 17 its concentration export products, and the size of inflow FDI. The results of this study  
15 18 emphasized the need of digital infrastructure development and regulation that facilitate access  
16 19 to the internet.  
17 20

18 21 Pradhan et al. (2017) also studied the association between FDI, economic growth, and use of  
19 22 communication technology in 21 Asian countries during 1965–2012. Communication  
20 23 technology included fixed telephone, mobile phone, and internet use and service including  
21 24 fixed broadband. The results of the study show that there was a positive association between  
22 25 FDI, economic growth, and communication technology. Using the Granger causality analysis,  
23 26 these three variables were positively related.  
24 27

25 28 A study on the association between FDI and internet use in 10 ASEAN countries had been  
26 29 carried out (Ramdan et al. 2020). It was found that higher internet use was associated with  
27 30 higher FDI. A 1% increase in FDI was associated with a 0.0681 increase in internet use.

### 40 43 2.3. Data and Methods

Formatted: Normal, No bullets or numbering

41 44 This study used data from the World Bank (2021). The unit of analysis was country,  
42 45 covering 186 countries in the world. The study period was from 2001 through 2017. Therefore,  
43 46 there were 3,162 observations in this study. The countries and study period were selected based  
44 47 on the availability of data on variables used in the study. In addition, the selected countries  
45 48 were classified by demographic dividend type by the World Bank (Appendix Table A).

The dependent variable was the information technology, that is the individuals using the internet (% of population). The independent variables were the demographic variable and economic variables. The demographic variable was the type of demographic dividend (TDD) which was a categorical variable (=0 if pre, =1 if early, =2 if late, and =3 if post). Therefore, there were three (3) dummy variables for TDD, that is *EarlyDD* (=1 if early, =0 otherwise), *LateDD* (=1 if late, =0 otherwise), and *PostDD* (=1 if post, =0 otherwise), and pre-demographic dividend was the reference category. Meanwhile, the economic variables included access to electricity (% of population, *Electric*), gross domestic product (constant 2010 US\$, *GDP*), inflation, consumer prices (annual %) (*Inflation*), and foreign direct investment (*FDI*), net inflows (% of GDP).

This study employed panel data analyses. The econometric model used was a fixed effects regression model using income level group, regional group, and year as identifiers. This model was also carried out based on G20 country group and income level group. The proposed model in this study was as follows.

$$Internet_{it} = \beta_0 + \beta_{11}EarlyDD_{it} + \beta_{12}LateDD_{it} + \beta_{13}PostDD_{it} + \beta_2Electric_{it} + \beta_3 \ln(GDP)_{it} + \beta_4 Inflation_{it} + \beta_5 FDI_{it} + \epsilon$$

This fixed effects regression model still had endogeneity problem and measurement errors in the variables used. The demographic dividend type can influence internet use and on the other hand internet use can affect the demographic dividend type. In addition, the demographic dividend type is endogenous, that is a variable that is influenced by other variables. Therefore, other approaches were employed as robustness checks using the static generalized method of moment (GMM). This GMM is a simultaneous model between an endogenous variable and instrument or exogenous variables in the first stage regression and an endogenous model between the dependent variable and independent variables in the second stage regression. The instrument variables used consisted of crude death rate (deaths per 1,000 people, *CDR*), population density (population per km<sup>2</sup>, *Density*), and crude birth rate (births per 1,000 people, *CBR*).

Formatted: Font: (Default) Times New Roman

The first stage regression model was as follows.

$$TDD_{it} = \alpha_0 + \alpha_{11}CDR_{it} + \alpha_{12}Density_{it} + \alpha_{13}CBR_{it} + \alpha_2Electric_{it} + \alpha_3 \ln(GDP)_{it} + \alpha_4 Inflation_{it} + \alpha_5 FDI_{it} + \epsilon$$

The second stage regression model was as follows.

$$Internet_{it} = \beta_0 + \beta_{11}EarlyDD_{it} + \beta_{12}LateDD_{it} + \beta_{13}PostDD_{it} + \beta_2Electric_{it} + \beta_3 \ln(GDP)_{it} + \beta_4 Inflation_{it} + \beta_5 FDI_{it} + \epsilon$$

The endogeneity problem can result in biased and inconsistent estimates when there is lag in dependent variable. This problem can be solved by employing the dynamic panel GMM model. Arellano and Bond (1991) proposed the GMM approach. There are two reasons of applying GMM approach. First, GMM is a common estimator that gives a framework for comparison and evaluation. Second, GMM gives simple alternative to other estimators in particular maximum likelihood.

However, GMM estimators also have some limitations. First, GMM estimator is asymptotically efficient if the sample size is large, but inefficient if the sample size is finite. Second, the estimator sometimes needs a number of programming implementation so that it needs software that can support GMM approach application.

There are three estimation methods that are commonly used in GMM framework, that is first-differences GMM (FD-GMM) or Arellano-Bond GMM (AB-GMM), system GMM (SYS-GMM), and “difference” and “system” GMM dynamic panel estimator. This study employed “difference” and “system” GMM dynamic panel estimator to analyze the estimators. This model was selected because the demographic dividend type was time invariant and the model can solve this problem.

This study used data from the World Bank (2021). The unit of analysis was country, covering 186 countries in the world. The study period was from 2001 through 2017. Therefore, there were 3,162 observations in this study. The dependent variable was the information technology, that is the individuals using the internet (% of population). The independent variables were the demographic variable and economic variables. The demographic variable was the typology of demographic dividend that consisted of pre-, early (*EarlyDD*), late (*LateDD*), and post-demographic dividend (*PostDD*) with pre-demographic dividend typology as the reference category. Meanwhile, the economic variables included access to electricity (% of population,

*Electric*), gross domestic product (constant 2010 US\$, *GDP*), inflation, consumer prices (annual %) (*Inflation*), and foreign direct investment (*FDI*), net inflows (% of GDP).

Data in this study were analyzed using univariate, bivariate, and multivariate analyses. For the univariate analysis, the percentage distribution of countries by the demographic dividend typology and the summary statistics (the number of observations, the mean, standard deviation, minimum, and maximum) of the continuous variables in the model were given. For the bivariate analysis, the average percentage of individuals using the internet by the demographic dividend typology and simple regression analyses between the internet use and economic variables were performed. For the multivariate analysis, a multiple regression with random effects was carried out to investigate the demographic and economic determinants of internet use in countries in the world during 2001–2017. The model was as follows:

$$\text{Internet} = \beta_0 + \beta_{11}\text{EarlyDD} + \beta_{12}\text{LateDD} + \beta_{13}\text{PostDD} + \beta_2\text{Electric} + \beta_3\ln(\text{GDP}) + \beta_4\text{Inflation} + \beta_5\text{FDI} + \varepsilon$$

### 3.4. Results

The results of univariate analysis are presented in Figure 3 and Table 1. It can be seen from Figure 3 that the majority of countries in the world were in early demographic dividend typology (33.3%), followed by in late demographic dividend typology (27.4%), in post-demographic dividend typology (20.4%), and in pre-demographic dividend typology (18.8%). Meanwhile, it can be seen from Table 1, the percentage of individuals using the internet ranged from none in Timor Leste in 2001 to almost universal of 98.3% in Iceland in 2017 and the percentage of population with access to electricity varied from a low of 0.53% in Liberia in 2001 to universal, 100%, in Iceland in 2017. Further, the GDP constant ranged between US\$143.2 thousand in Kiribati in 2001 and US\$17.4 trillion in the United States in 2017, the annual inflation (consumer prices) varied from a low of -18.1% in Bhutan in 2004 to a high of 359.9% in the Democratic Republic of Congo in 2001, and the current net inflows foreign direct investment differed from -58.2% in Luxembourg in 2007 to 56.5% in Malta in 2007.

The results of bivariate analysis are displayed in Figure 4–Figure 8. These are the average percentage of individuals using the internet by the demographic dividend typology (Figure 4) and the scatter diagrams, simple regression equations and lines, and coefficient determinations between each independent variable in the model and the dependent variable (Figure 5–8). It can be seen from Figure 4 that the average percentage of individuals using the internet was

lowest in pre demographic dividend typology countries (5.5%) and highest in post demographic dividend typology countries (61.5%).

Figure 5 shows that there was a positive relationship between access to electricity and internet use. An increase of one percent in population with electricity was related with an increase of about 0.56% in the individuals using the internet. The coefficient of determination was 0.366 indicating that 37% of the variation in the individuals using the internet can be explained by the variation in the access to electricity.

Figure 6 shows that there was a positive relationship between ln(GDP) and internet use. An increase of one percent in economic growth (GDP constant 2010) was correlated with an increase of about 0.35% in the individuals using the internet. The coefficient of determination was 0.0008 suggesting that ln(GDP) can explain the variation in the individuals using the internet by 0.08%.

Figure 7 indicates that there was a negative relationship between inflation and internet use. An increase of one percent in inflation was related with a decline of about 0.43% in the individuals using the internet. The coefficient of determination was 0.029 indicating that 2.9% of the variation in the individuals using the internet can be explained by the variation in inflation.

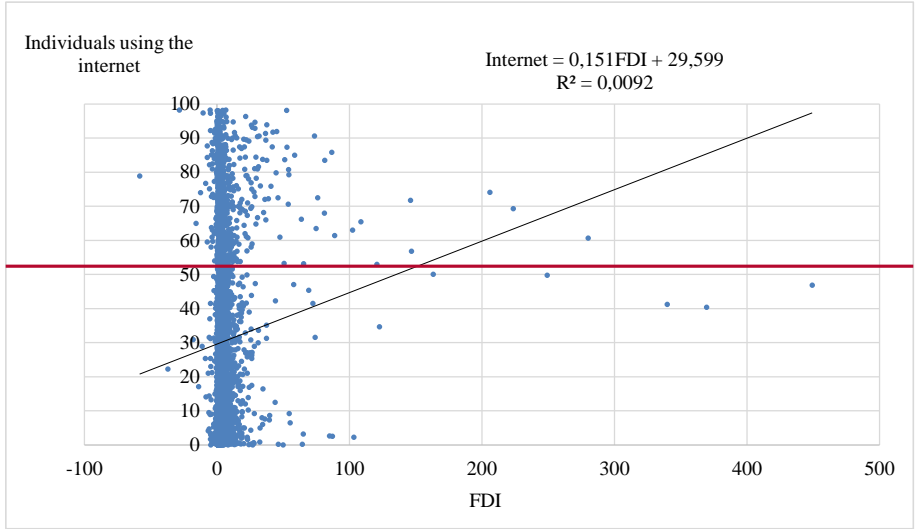

Source: World Bank (2021) (Author's compilation).

**Figure 8**

**Foreign direct investment (net inflows, % of GDP) and Individuals using the internet (% of population): World 2001–2017**

It can be seen from Figure 1 the majority of countries in the world were in early-demographic dividend type (33.3%), followed by in late-demographic dividend type (27.4%), in post-demographic dividend type (20.4%), and in pre-demographic dividend type (18.8%). The majority of countries in early-demographic dividend type were African countries, such as Angola, Benin, Chad, Eritrea, Kenya, Niger, Sudan, Togo, Uganda, and Zambia (Appendix Table A). Meanwhile, most developed countries were in post-demographic dividend countries, such as Australia, Belgium, Canada, Denmark, Germany, Japan, Norway, Singapore, United Kingdom, and United States.

**Figure 1**  
**Percentage distribution of countries by demographic dividend typology (%):**  
**World 2001–2017**

The number of observation and mean of variables used in the study both for full observations and by demographic dividend type was presented in Table 1. It can be seen that there was a significant variation in internet use across countries in the world and across demographic dividend types. The mean of individuals using the internet was 30.5% for full observations, lowest in pre-demographic dividend countries (only 5.5%), 18.3% in early-demographic dividend countries, 39.7% in late-demographic dividend countries, and highest in post-demographic dividend countries (61.4%). Other variables also show disparities in demographic and economic features across countries and demographic dividend types that reflects better development achievement in more developed countries.

**Table 1. Number of observations (n) and mean of variables in the study for full observation and by demographic dividend type.**

Variable	Full Observation		Pre-Demographic Dividend		Early-Demographic Dividend		Late-Demographic Dividend		Post-Demographic Dividend	
	n	Mean	n	Mean	n	Mean	n	Mean	n	Mean
Individuals using the internet (% of population)	3,162	30.5	595	5.5	1,054	18.3	867	39.7	646	61.4
Access to electricity (% of population)	3,162	78.3	595	31.4	1,054	75.7	867	97.5	646	99.9
GDP (constant 2010 US\$)	3,162	3.47E+11	595	2.76E+10	1,054	1.34E+11	867	2.52E+11	646	1.12E+12
Inflation, consumer prices (annual %)	3,162	6.0	595	8.3	1,054	7.10	867	5.0	646	3.2
Foreign direct investment, net inflows (% of GDP)	3,162	6.2	595	4.7	1,054	3.36	867	8.3	646	9.3
Death rate, crude (per 1,000 people)	3,162	8.3	595	10.9	1,054	7.00	867	7.4	646	9.1
Population density (people per sq. km of land area)	3,162	312.5	595	73.3	1,054	162.05	867	140.2	646	1,009.8

The results of diagnostic tests show that the residual approached normal distribution but statistically not normal (Jarque-Bera normality test was 52.24 and  $\chi^2 = 4.5E-12$ ). But, this assumption only applies for certain models. This assumption is not used if random effects regression, GMM, instrumental variables, and two-stage least squares (2SLS) are used.

The results of multicollinearity test show that there was no variance inflation factor (VIF) that was greater than 10. The mean of VIF was 2.650. In addition, there was no pairwise correlations that was greater than 0.5. It means there was no multicollinearity indication in the model.

There was heteroscedasticity in the model.  $\chi^2 = 1,726.32$  and  $\text{Prob} > \chi^2 = 0.000$ . This problem was solved by using STATA application by making the model that improved standard errors (robust standard errors).

The results of Chow test show that fixed effects model was better than pooled least squares model ( $F(3, 3151) = 181.13$ ,  $\text{Prob} > F = 0.000$ ). In addition, the results of Hausman test show that fixed effects model was better than random effects model ( $\chi^2 = 817.94$  and  $\text{Prob} > \chi^2 = 0.000$ ). Further, the results of Breusch and Pagan Lagrangian multiplier test show that random effects model was better than pooled least squares model.

The results of fixed effect regression using income level group, regional group, and year as identifiers show that in general demographic dividend had significant positive association with internet use (Table 2). After controlling for the economic features, the percentage of individuals using the internet was, respectively 6.5%–21% higher and 15%–39% higher in late-demographic dividend and post-demographic dividend countries than in pre-demographic dividend countries. This finding supported the results of a study by Lera-López et al. (2011) and Myovella et al. (2021) that found the role of demographic factor in increasing internet use in the world. More favorable demographic features, including being a late- and post-

demographic dividend country, had been an important factor of better development that could enhance access to information and communication technology including internet use.

Table 2 Results of Fixed Effects Regression based on Identifier.

Covariates	Identifier		
	Income level group	Regional group	Year
Early-Demographic Dividend	0.317 (1.221)	1.398 (1.425)	4.409*** (0.921)
Late-Demographic Dividend	6.507*** (1.542)	14.398*** (1.749)	21.101*** (1.588)
Post-Demographic Dividend	15.142*** (1.721)	30.349*** (1.939)	39.005*** (0.691)
Access to electricity (% of population)	0.216*** (0.021)	0.290*** (0.022)	0.161*** (0.035)
Inflation, consumer prices (annual %)	-0.115*** (0.028)	-0.176*** (0.030)	-0.070 (0.051)
log(gdpconstant2010us)	1.650*** (0.166)	1.958*** (0.183)	1.666*** (0.059)
Foreign direct investment, net inflows (% of GDP)	0.017 (0.018)	0.048** (0.019)	0.052*** (0.015)
Constant	-30.610*** (4.017)	-49.345*** (4.340)	-37.480*** (4.490)
Observations	3,162	3,162	3,162
R-squared	0.165	0.340	0.656
Fixed effects in income level group	Yes	No	No
Fixed effects in regional group	No	Yes	No
Fixed effects in year	No	No	Yes

Before a multiple regression was conducted, the multi-collinearity between the variables in the model were checked. It was found that there was no collinearity between variables in the model, except between the demographic dividend typology and electricity where the Spearman correlation coefficient was slightly above 0.7 (0.71). However, this did not have serious effects on the results of the regression. The results of the multiple fixed effects regression are given in Table 2. These include the regression coefficient, standard errors, and p value for each covariate. All covariates in the model had significant effects on internet use statistically. The coefficient of variation was 0.540 implying that 54.0% of the variation in the internet use could be explained by the model with a significance level below 0.001.

~~The demographic dividend typology was positively associated with the internet use. Late and post demographic dividend countries had higher percentage of individuals using the internet than pre-demographic dividend countries. After controlling for the effects of economic factors, the percentage of individuals using the internet was, respectively, 13.0% and 29.7% higher in the late and post demographic dividend countries than in the pre-demographic dividend countries. This result supports the finding by Lera López et al. (2011) on the importance of demographic factors on internet use. Countries with more advanced demographic change, that is late and post-demographic dividend typology had lower fertility levels and better economic development achievement so that individuals in these countries were more likely to have exposed to better development, including access internet than individuals in pre and early-demographic dividend typology countries.~~

~~Access to electricity was the strongest factor that affected-influenced internet use positively. The higher the percentage of population who had access to electricity, the higher the percentage of individuals using the internet. Other things being the same, an increase of one percent in the access to electricity was related to an increase of 0.27%-0.161% - 0.290% in the internet use. This finding is in accordance with the finding by Myovella et al. (2021) Salahuddin and Alam (2015) that found the positive association between internet use and electricity consumption and internet use. Access to electricity can boost the electricity-based economic activity and in today's industrial internet of things era, it is a key factor of internet use since the internet cannot be used without electricity.~~

~~Economic growth was had the second strongest factor of and had a positive effect on the internet use. The higher the economic growth, the higher the percentage of internet use. Ceteris paribus, an increase of one percent in economic growth was associated with an increase of internet use by 4.61.650% - 1.958%. This result supports the study result by Pradhan et al. (2017) and Amaluddin (2020) that found a positive relationship between economic growth and internet use. Economic growth allows a country to expand its economy that today heavily depends on the internet and hence increases internet use.~~

~~Inflation had a negative relationship with the percentage of individuals using the internet. The higher the inflation in a demographic dividend typology, the lower the percentage of individuals using the internet. After controlling for the effects of other factors, an increase of~~

one percent in inflation was associated with a decline of the percentage of individuals using the internet by 0.1~~8~~15 – 0.176%. This finding confirms the results of study by Yi & Choi (2005) that found a negative association between inflation and internet use. This is because inflation is a contributor of cost and price rise including internet cost that reduces internet use through the decline in people’s purchasing power including purchasing the internet because of the price rise across the economies.

Foreign direct investment (FDI) had a positive influence on internet use. The higher the FDI, the higher the internet use. An increase of one percent in FDI was related with an increase of the percentage of individuals using the internet by 0.0~~485~~485–0.052%. This results strengthens the study finding by Gnanon (2020) and Ramdan et al. (2020) that found a positive relationship between FDI and internet use through the capital addition-accumulation in an economy that can increase individuals’ access to the internet use.

The results of the above analyses also show that 16.5%–65.6% of variation in internet use was explained by demographic dividend type and economic features.

The above results still had heteroscedasticity and endogeneity effects problem. To obtain consistent and robust results, this study conducted robustness checks by employing other approaches and different sub-samples. The results were as follows.

This study presented the results of analyses employing fixed effects, random effects, and pooled least square model. The results of the three models gave consistent results that demographic dividend type had positive effects on internet use significantly. The percentage of individuals using internet was 13%–14% and around 30% higher in, respectively, late- and post-demographic dividend countries than in pre-demographic dividend countries (Table 3). In addition, higher percentage of individuals using internet was associated with higher percentage of access to electricity, economic growth, and FDI and associated with lower inflation. A one percent increase in, respectively, access to electricity, economic growth, FDI, and inflation was associated with, respectively, an increase of about 0.3%, 2%, and 0.05% individuals using internet and a decline of 0.2% individuals using internet.

In Table 4, the results of analyses of fixed effects regressions for full observation and by income group were presented. It can be seen that the results were consistent with the previous results of the positive association between demographic dividend type, electricity, economic growth, and FDI with internet use and negative association between inflation and internet use. In addition, the effect of demographic dividend was largest in upper middle income countries and insignificant in high income countries.

In Table 5, the results of analyses of fixed effects regression for full observation and by year were presented. It can be seen that the results were also consistent with the previous results of the positive association between demographic dividend type, electricity, economic growth, and FDI with internet use and negative association between inflation and internet use. In addition, the percentage of individuals using internet was significantly higher in early-demographic dividend countries than in pre-demographic dividend countries in 2007–2012 and in 2013–2017 with an increasing effect.

The 2SLS model used CDR, population density, and CBR as instrumental variables. The results of diagnostic test for instrumental variable in 2SLS and GMM model show that  $F(1, 3154) = 69.68$ , which was greater than 10, and  $\text{Prob} > F = 0.0000$ , meaning that the models had strong instrumental variables. In addition, the results for first stage regression show that Sanderson-Windmeijer (SW) first-stage chi-squared and F statistic was significant, meaning that all instrument variables were relevant or valid to explain the endogeneous variable (demographic dividend type). The results of the first stage regression of 2SLS model were presented in Table 6.

The results of second stage regression for full observations and based on income group were given in Table 7. It can be seen that the 2SLS method results for full observations were also consistent with the previous results. The percentage individuals using the internet was significantly higher in early-, late-, and post-demographic dividend countries than in pre-demographic dividend countries, but with much higher percentages than in the previous models. In addition, the percentage individuals using the internet was also significantly higher in countries with lower inflation and higher economic growth and FDI. By income group, demographic dividend type had significant positive effects on internet use in low and high income countries.

#### 4.5. Conclusions

In this study the nexus between demographic and economic features with internet use in countries during 2001–2017 was investigated. A fixed effects regression model using income level group, regional group, and year as identifiers was employed to study the association between the type of demographic dividend, access to electricity, gross domestic product, inflation, and foreign direct investment and internet use. Robustness checks were also carried out using the static generalized method of moment between the type of demographic dividend and instrument variables (crude death rate, population density, and crude birth rate) in the first stage regression and between the type of demographic dividend, access to electricity, gross domestic product, inflation, and foreign direct investment and internet use in the second stage regression.

The results of this study confirms the previous studies on the nexus between demographic and economic features with internet use (e.g. Filippova and Turutina (2015); Sharma et al. (2015); Baumann et al. (2017); Pradhan et al. (2017); Scheerder et al. (2017); Wang et al. (2019); Singh et al. (2020); Bianchini et al. (2021); Myovella et al. (2021); Yesuf (2021)). It was found that internet use was higher in countries from late- and post-demographic dividend type. Meanwhile, access to electricity, economic growth, and foreign direct investment had a positive association with internet use and inflation was negatively associated with internet use.

Therefore, it is recommended that in order to boost up internet use, which is essential for better development achievement, government of countries, in particular countries in the pre- and early-demographic dividend type, should manage its demographic features to the more favorable ones, i.e. lower fertility and mortality. In addition, the window of opportunity due to the decline of fertility and mortality should be capitalized in order to reap the demographic dividend of economic growth and family welfare acceleration by improving access to quality health, education, and employment opportunity. Regarding economic features, in order to

**Limitations**

A limitation of this study is that the demographic dividend type was a time invariant variable, while other variables were time variant. However, this limitation should not significantly affect the findings and this study still provides an essential contribution to the study of internet usage. So, it is suggested that further research on the determinants of internet usage should employ time variant demographic change variable.

~~5. The results of this study confirms the previous studies on the nexus between demographic change and economic features with internet use. Countries from post demographic dividend typology with better access to electricity, higher economic growth, lower inflation, and higher foreign direct investment had higher internet use. Therefore, it is recommended that in order to boost up internet use, which is essential for better development achievement, government of countries should manage its demographic change, increase access to electricity, improve economic growth, reduce inflation, and enhance foreign direct investment.~~

Title: The Demographic and Economic Features: The Nexus with Internet Use

Journal: Heliyon

Dear Dr. Rajagukguk,

Thank you for submitting your manuscript to Heliyon.

We have now received all of the editor and reviewer comments on your recent submission to Heliyon. Your paper will become acceptable for publication after implementation of minor formatting and/or administrative changes outlined below. To avoid unnecessary delays in the publication of your manuscript, please do not make any other additional changes during this revision.

Please reference all numbered tables in text. Currently, table [6] in the manuscript have not been cited in text.

To submit your revised manuscript, please log in as an author at <https://www.editorialmanager.com/heliyon/>, and navigate to the "Submissions Needing Revision" folder under the Author Main Menu. When submitting your revised manuscript, please ensure that you upload your most recent document with the "Revised manuscript file - highlighting revisions made" item type.

Kind regards,

Yating Zhang  
Editorial Section Manager  
Heliyon

Embargo

Embargos are not automatically set for papers published in Heliyon. Papers appear online a few days after acceptance. To request a media embargo and/or publication on a specific date to assist an institutional press release, please reach out to the Heliyon team (info@heliyon.com) as soon as possible and we will do our best to accommodate your request.

Heliyon is an online publication and we do not impose a limit on the length of the article or the number of figures. If you have supplementary content you would prefer not to combine with your main manuscript file please ensure all your supplementary files are self-contained and can stand alone (title, legend, etc), that all labels and names within the supplementary content are unique to avoid duplication, and that these files are referenced within the main text. Please also ensure that the file name for each file is labelled as the file is referenced in-text, as that is how they will be named on our website. If you have any supplementary videos/audio files please provide a title and legend at the end of your manuscript for these.

Editor and Reviewer comments:

Reviewer's Responses to Questions

Note: In order to effectively convey your recommendations for improvement to the author(s), and help editors make well-informed and efficient decisions, we ask you to answer the following specific questions about the manuscript and provide additional suggestions where appropriate.

1. Are the objectives and the rationale of the study clearly stated?

Please provide suggestions to the author(s) on how to improve the clarity of the objectives and rationale of the study. Please number each suggestion so that author(s) can more easily respond.

Reviewer #6: Yes

Reviewer #8: The objectives are now clearly stated.

Reviewer #9: yes, clearly stated.

-----

2. If applicable, is the application/theory/method/study reported in sufficient detail to allow for its replicability and/or reproducibility?

Please provide suggestions to the author(s) on how to improve the replicability/reproducibility of their study. Please number each suggestion so that the author(s) can more easily respond.

Reviewer #6: Mark as appropriate with an X:

Yes  No  N/A

Provide further comments here:

Yes

Reviewer #8: Mark as appropriate with an X:

Yes  No  N/A

Provide further comments here: The application of the theory and method reported are sufficient.

Reviewer #9: Mark as appropriate with an X:

Yes  No  N/A

Provide further comments here:

yes

-----

3. If applicable, are statistical analyses, controls, sampling mechanism, and statistical reporting (e.g., P-values, CIs, effect sizes) appropriate and well described?

Please clearly indicate if the manuscript requires additional peer review by a statistician. Kindly provide suggestions to the author(s) on how to improve the statistical analyses, controls, sampling mechanism, or statistical reporting. Please number each suggestion so that the author(s) can more easily respond.

Reviewer #6: Mark as appropriate with an X:

Yes  No  N/A

Provide further comments here:

Yes

Reviewer #8: Mark as appropriate with an X:

Yes  No  N/A

Provide further comments here: The statistical analyses, controls, sampling mechanism, and statistical are well described.

Reviewer #9: Mark as appropriate with an X:

Yes  No  N/A

Provide further comments here:

yes

-----

4. Could the manuscript benefit from additional tables or figures, or from improving or removing (some of the) existing ones?

Please provide specific suggestions for improvements, removals, or additions of figures or tables. Please number each suggestion so that author(s) can more easily respond.

Reviewer #6: No

Reviewer #8: The listed Tables in the manuscript are adequate and well explained.

Reviewer #9: fair enough

-----

5. If applicable, are the interpretation of results and study conclusions supported by the data?

Please provide suggestions (if needed) to the author(s) on how to improve, tone down, or expand the study interpretations/conclusions. Please number each suggestion so that the author(s) can more easily

respond.

Reviewer #6: Mark as appropriate with an X:

Yes  No  N/A

Provide further comments here:

Yes

Reviewer #8: Mark as appropriate with an X:

Yes  No  N/A

Provide further comments here: The interpretation of results and study conclusions are supported by the data.

Reviewer #9: Mark as appropriate with an X:

Yes  No  N/A

Provide further comments here:

yes

-----

6. Have the authors clearly emphasized the strengths of their study/theory/methods/argument?

Please provide suggestions to the author(s) on how to better emphasize the strengths of their study. Please number each suggestion so that the author(s) can more easily respond.

Reviewer #6: Yes

Reviewer #8: The author has emphasized the strengths of the study/theory/methods/argument.

Reviewer #9: yes

-----

7. Have the authors clearly stated the limitations of their study/theory/methods/argument?

Please list the limitations that the author(s) need to add or emphasize. Please number each limitation so that author(s) can more easily respond.

Reviewer #6: Yes

Reviewer #8: The author has clearly stated the theory applied, methods and argument.

Reviewer #9: yes

-----

8. Does the manuscript structure, flow or writing need improving (e.g., the addition of subheadings, shortening of text, reorganization of sections, or moving details from one section to another)?

Please provide suggestions to the author(s) on how to improve the manuscript structure and flow. Please number each suggestion so that author(s) can more easily respond.

Reviewer #6: No

Reviewer #8: The structure of the manuscript, flow of writing and reorganisation are adequately written.

Reviewer #9: fair enough

-----

9. Could the manuscript benefit from language editing?

Reviewer #6: No

Reviewer #8: No

Reviewer #9: Yes

Reviewer #6: This field is optional. If you have any additional suggestions beyond those relevant to the questions above, please number and list them here.

Reviewer #8: This field is optional. If you have any additional suggestions beyond those relevant to the questions above, please number and list them here.

N/A

Reviewer #9: This field is optional. If you have any additional suggestions beyond those relevant to the questions above, please number and list them here.

Dear Dr. Rajagukguk,

Thank you for submitting your manuscript to Heliyon.

I am pleased to inform you that your manuscript has been accepted for publication.

Your accepted manuscript will now be transferred to our production department. We will create a proof which you will be asked to check, and you will also be asked to complete a number of online forms required for publication. If we need additional information from you during the production process, we will contact you directly.

We appreciate and value your contribution to Heliyon. We regularly invite authors of recently published manuscript to participate in the peer review process. If you were not already part of the journal's reviewer pool, you have now been added to it. We look forward to your continued participation in our journal, and we hope you will consider us again for future submissions.

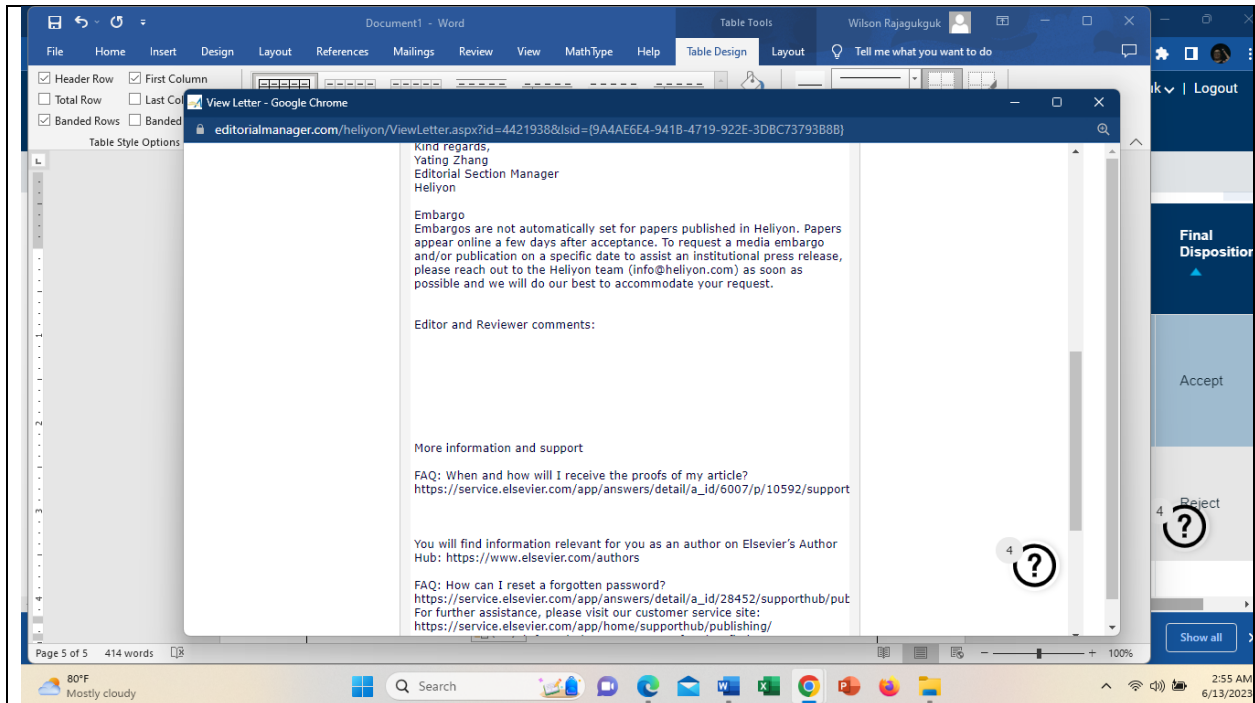

Kind regards,  
 Yating Zhang

# The Demographic ~~Change~~ and Economic Features: The Nexus with Internet Use

Wilson Rajagukguk

Faculty of Economic and Business, Universitas Kristen Indonesia

Email: wrajagukguk@yahoo.com

## Abstract

The goal of this study was to examine the nexus between demographic ~~change~~ ~~dividend type~~ and economic features with internet use. The data source was from the World Development Indicator of the World Bank. ~~The unit analysis was country. The Ppanel data analysis methods were used for the examination, employing fixed effects regression models using country income level, country regional group, and year as identifiers, random effects regression, and pooled least square models. The unit analysis was country.~~ The random effects regression model, pooled least square model, and static generalized method of moments ~~and two stage least square~~ were utilized ~~as for the~~ robustness checks. The dependent variable was the percentage of population using the internet. The independent variables consisted of demographic and economic variables. The demographic variable was the demographic dividend ~~typology~~, while the economic variables were access to electricity, GDP, inflation rate, and foreign direct investment. The results of fixed effects regression indicate that ~~using country income level, country regional group, and year as identifiers and~~ after controlling for the economic features, higher internet use in a country was associated with late- and post-demographic dividend ~~typology~~ ~~type~~. Higher internet ~~use~~ was also associated with higher access to electricity, higher GDP, lower inflation rate, and higher foreign direct investment inflow. ~~The r~~Robustness checks using random-effects and pooled least square models, using fixed-effects model by country income level, using two-stage least square, and using second stage regression by G20 and non-G20 country group division ~~and year~~, similarly gave consistent results. ~~The association of internet use with the demographic and economic features may imply that population-based and economic development program should be enhanced toward the favorable ones that increase internet usage among the population.~~

Key words: Demographic dividend ~~typology~~, economic determinants, internet use, fixed effects.

## 1. Introduction

The world is marked by a considerable inequality in human development achievement. The United Nations Development Programme (UNDP) reported that in 2019 the human development index (HDI) varied greatly from a lowest of 0.394 in Niger to a highest of 0.957 in Norway (UNDP, 2020). This disparity could be attributed to the inequity in access to digital technology, including broadband internet.

Formatted: Numbering: Continuous

43 Widespread access to broadband internet is a key driver of human development. Improving  
44 access to the internet is also identified as an instrument to achieve the Sustainable Development  
45 Goals (SDGs) in goal 4 (Quality education), goal 9 (Industry, innovation, and infrastructure),  
46 and goal 17 (Partnership for the Goals). Internet allows people to be connected, work, shop,  
47 and study especially during the COVID-19 pandemic lockdowns (United Nations, 2021).

Formatted: Font color: Text 1

48  
49 Internet can be used as an instrument to develop an economy and to pursue a more developed  
50 economy. Adelere and Itasanmi (2016) argued that internet increases the participation and  
51 motivates illiteracy alleviation. Internet is also an effective means in adult literacy program.  
52 Further, study by Kouton (2019) found that the use of internet reduced energy demand used for  
53 heating and transportation. This saving allowed the government to allocate energy generator  
54 budget to other sectors.

55  
56 The World Bank (2022) estimated that increasing internet penetration from 35% to 75% of the  
57 population in all developing countries could increase about US\$2 trillion to their joined gross  
58 domestic product and generate more than 140 million works around the world. However, there  
59 wasere a great inequality in the internet access across the world.

60 The World Bank (2021) reported that in 2019, among 174 countries in the world where the  
61 data was available, this access varied greatly across countries, lowest in Burundi (5.2%) and  
62 almost universal in Bahrain (99.7%).

Formatted: Font color: Text 1

Formatted: Font color: Text 1, English (United States)

Formatted: Font color: Text 1

63  
64 Information and communication technology (ICT), in particular internet, is a most developed  
65 business and business product in this century. The study of ICT encounters economists and  
66 demographers with two sides, as consumers and producers. As it can be seen from Figure 1,  
67 There was a rapid increase of internet consumers in the world. The percentage of internet  
68 users in the world from 1990–2018 increased from 0% in 1990 to 51% in 2018 only in 28 years.  
69 The time trends of the percentage of internet users was not the linear one, but the power one.  
70 Therefore, the internet business is a promising one.

71  
72 ~~Improving access to the internet is also identified as an instrument to achieve the Sustainable~~  
73 ~~Development Goals (SDGs) in goal 4 (Quality education), goal 9 (Industry, innovation, and~~  
74 ~~infrastructure), and goal 17 (Partnership for the Goals). Internet allows people to be connected,~~  
75 ~~work, shop, and study especially during the COVID-19 pandemic lockdowns (United Nations~~  
76 ~~21). However, there were a great inequality in the internet access across the world.~~

On the other hand, decline in fertility and mortality level and change in migration patterns have caused countries to experience demographic change that has been related to demographic dividend. Demographic dividend is economic growth as the results of changes in age structure in a country due to the decline in family size and longer life that cause increase in the percentage of productive age population aged 15–64 years old. As a result, lower investment is needed for young population aged 0–14 years old. At the same time, productive age population increases that open the window of opportunity to accelerate economic growth and family welfare. At micro level, this demographic transition can result in family living standard improvement and higher income. At macro level, demographic transition can affect economic development in a country.

It is proposed that demographic change can have a positive contribution to development (e.g. Ahmed et al. 2016), including economic and information and communication technology development. Demographic change of fertility and mortality decline could help create a period

98 of sustainable economic growth as happened in some East Asian economies (e.g. Bloom et al.,  
99 2020; Amornkitvikai, Y. et al., 2022, Hosan et al., 2022, Liu and McKibbin, 2022). The  
100 mechanism of growth that is the policy area is through public health, family planning,  
101 economic policy that promote labor market flexibility, trade openness, and saving. The  
102 government of countries has window of opportunity to capitalize productive age population to  
103 reap the demographic dividend of economic growth and family welfare acceleration. This  
104 economic growth then enables countries to enlarge their heavily internet-based economies and  
105 consequently rises internet usage (Pradhan et al., 2017; Anuj, et al. 2018; Amaluddin 2020).

107 ➔  
108 Bonus demografi adalah pertumbuhan ekonomi yang merupakan hasil dari perubahan struktur  
109 umur sebuah negara, perubahan dari sebuah keluarga yang besar berumur pendek menjadi  
110 keluarga kecil dan berumur berumur lebih panjang.

Formatted: Font: (Default) Times New Roman, Not Highlight

Formatted: Line spacing: 1.5 lines

111  
112 Karena perubahan dalam distribusi umur, diperlukan investasi yang lebih sedikit untuk  
113 membangun penduduk kelompok usia mudda dan kemudian sumberdaya yang lebih besar  
114 digunakan untuk pembangunan (economic gift). Berbarengan dengan hal tersebut, Angkatan  
115 kerja bertumbuh lebih cepat (more rapidly) dibandingkan dengan penduduk yang tergantung  
116 padanya menciptakan sebuah jendela kesempatan percepatan pertumbuhan ekonomi dan  
117 kesejahteraan keluarga. Dalam skala mikro, transisi ini dapat berbuah dalam perbaikan  
118 standar hidup keluarga dan pendapatan yang lebih tinggi. Dalam tingkat makro hal ini dapat  
119 mempengaruhi perkembangan ekonomi sebuah negara.

120  
121  
122 -Ahmed et al. (2016) grouped countries into four demographic dividend typology-type based  
123 on the demographic change and economic development achievement. The demographic  
124 dividend typology is classified as the pre-, early-, late-, and post-demographic dividend.  
125 Countries with a fertility level above four children per woman, increasing percentage of  
126 working age population (15–64 years), and low income level are categorized as the pre-  
127 demographic dividend countries. Meanwhile, countries with a fertility level between 2.1 and  
128 four children per woman, increasing percentage of working age population, and low-middle  
129 and middle-high income level are categorized as the early-demographic dividend countries.  
130 Further, countries with a fertility level below 2.1 children per woman, increasing percentage of  
131 working age population, and high income level are also categorized as the early-demographic

132 dividend countries. Furthermore, countries with a fertility level between 2.1 children and four  
133 per woman, declining percentage of working age population, and low, low-middle, and middle-  
134 high income level are categorized as the late-demographic dividend countries. Lastly, countries  
135 with a fertility level below 2.1 children per woman, decreasing percentage of working age  
136 population, and high income level are categorized as the post-demographic dividend countries.

137  
138 ~~It is proposed that demographic change can have a positive contribution to development (e.g.~~  
139 ~~Ahmed et al. 2016), including information and communication technology development. As it~~  
140 ~~can be seen from Figure 2, there was a significant difference in the percentage of internet~~  
141 ~~users and its trends across the demographic dividend typologies. The percentage of internet~~  
142 ~~users was consistently highest in the post-demographic dividend countries, followed by in the~~  
143 ~~late- and early-demographic dividend countries, and lowest in the pre-demographic dividend~~  
144 ~~countries. It also can be seen that during 1990–2018 the percentage of internet users during~~  
145 ~~1990–2018 increased more rapidly in more developed countries, the post-demographic~~  
146 ~~dividend typology countries.~~

147  
148 The determinants of internet use have been proposed (e.g. Scheerder et al. 2017). These include  
149 demographic and socioeconomic factors. The association between demographic and economic  
150 features and information and communication technology has also been studied (e.g. Bianchini  
151 et al. 2021; Yesuf, -2021; Singh et al. 2020; Baumann et al. 2017). However, a summary of the  
152 reviewed literature revealed that no study on demographic dividend type and internet use had  
153 been carried out. In order to address the gap indicated above, in general this study sought to

197 Singh, S., Sahni, M. M., & Kovid, R. K. (2020). Melakukan studi bahwa kegunaan yang  
198 dirasakan (Perceived usefulness) dan Pengaruh social (social influence) merupakan determinan

Formatted: Font color: Text 1

199 kunci niat perilaku menggunakan layanan Fintech. Selanjutnya ditemukan bahwa digital  
200 behavior serta karakteristik demografi (umur dan gender) memperkuat hubungan tersebut

201 ▲  
202 Filippova, I., & Turutina, E. (2015) menggunakan sampel yang merupakan representasi seluruh  
203 penduduk Rusia melakukan studi mengukur secara empiris penggunaan internet dalam proses  
204 Pendidikan di Rusia. Perbedaan umur dan gender, finansial status, dan tingkat Pendidikan  
205 merupakan determinan penggunaan internet untuk tujuan pendidikan.

206  
207 Online health information seeking behavior (OHISB) is currently a widespread and common  
208 behavior that has been described as an important prerequisite of empowerment and health  
209 literacy Baumann, E., Czerwinski, F., & Reifegerste, D. (2017). Ditemukan bahwa factor  
210 demografi seperti status sosio ekonomi, umur, gender merupakan determinan penting untuk  
211 OHISB. Wang, J., Xiu, G., & Shahzad, F. (2019) selain faktor kunci untuk OHISB seperti  
212 self-efficacy, Internet experience, and perceived ease of use, membagi determinan OHISB ke  
213 dalam empat kategori yakni demographic characteristic factors, cognitive factors, internal  
214 factors, and external factors.

215  
216  
217  
218  
219 Sharma, S. K., Govindaluri, S. M., & al Balushi, S. M. (2015) melakukan riset mengeksplorasi  
220 determinan utama dari pemakai internet banking. Menggunakan Two staged regression  
221 ditemukan bawah service quality, trust, perceived usefulness, percieve ease of use, attitude and  
222 demographic variabels merupakan dterminan internet banking users.

246  
247  
248 Bonus demografi memainkan peran penting sehubungan dengan hampir 850 Juta pelanggan  
249 langganan seluler (4 kali penetrasi Internet yang mencapai sekitar 205 Juta) di India  
250 (Burrage, V.,2017). Pasca liberalisasi ekonomi India, pengembangan system perbankan  
251 mengalami pertumbuhan yang sama dengan penduduk. Sering dengan pertumbuhan  
252 penduduk, permintaan dan tantangan juga meningkat dalam perkembangan system perbankan  
253 dan pembayaran. Untuk mengangani permasalahan ini pemerintah India mendisain sangat  
254 banyak strategi untuk meningkatkan ekonomi massa di India. Pemerintah India memulai  
255 program inklusi keuangan untuk mendapatkan pertumbuhan yang berkesinambungan melalui  
256 isu sosial seperti pengentasan kemiskinan (removing poverty), pendidikan untuk semua, dan  
257 well balance society melalui sitem keuangan dapat diperkuat. Skenario ini berbuah banyak  
258 (fruitful) karena India mempunyai advantage of demographic advantage, technological  
259 advancement, dan financial literacy, peningkatkan penetration of Internet technology, dan juga  
260 penetration of mobil technology melalui smartphone. Demographic dividen memainkan  
261 sebuah peranan krusial. Hal ini mendorong perkembangan dan sebuah kompetisi yang lebih  
262 ketat dalam system pembayaran diluar insitisi.

298 Slazus, B. J., & Bick, G. (2022). Factors that Influence FinTech Adoption in South Africa: A  
299 Study of Consumer Behaviour towards Branchless Mobile Banking. Athens Journal of  
300 Business & Economics, 8(1). <https://doi.org/10.30958/ajbe.8-1-3>

301  
302 Pemakaian luas mobile phot dan pertumbuhan penetrasi internet telah menciptakan sebuah  
303 kesempatan unit untuk meningkatkan pelayanan keuangan. Perusaann Financial Technology  
304 (FinTech) dan mobile banking (m-banking) membedakan konsumen menggunakan platform  
305 digital menggunakan jasa finansial tanpa dipelukan akses fisik sebagaimana yang terjadi pada  
306 bank tradisional (Slazus, B. J., & Bick, G. ,2022). Pertumbuhan FinTech berdampak pada  
307 pertumbuhan ekonomi keluarga dan sebuah bangsa.

308  
309  
310 Teknologi ingernet telah memecahkan batas batas ruang geographical tradisional.  
311 mempersingkat jarak tempuh antar wilayah, memaksimalkan integrasi berbagai sumberdaya.  
312 Dalam era teknologo digital, perkembangan jaringan internet yang cepat, dapat menghemat  
313 pemakaian dan konsumsi energi (Ren, S., Hao, Y., Xu, L., Wu, H., & Ba, N. ,2021).terjadi  
314 hbubungan negatif antara pengebangan internet dengan struktur konsumsi energi melalui  
315 pertumbuhan ekonomi, investasi R&D, human capital, financial development dan struktur  
316 industrial di China.

317  
318 Wu, S., Wang, P., & Sun, B. (2022) menggunakan city level data from China for the period  
319 2003-15 menemukan bahwa internet mempengaruhi disparitas ekonomi antar kota di Chian  
320 melalui dampak heterogeneous pada pertumbuhan ekonomi. Internet memperlebar disparitas  
321 ekonomi antar kota dengan angka penetrasi internet yang rendah dan kota dengan angka  
322 penetrasi internet yang tinggid.

346  
347  
348 Bianchini et al. (2021) studied the impacts of age and ideological identification on the use  
349 online social network to obtain political information. They found that socio-demographic fac-  
350 tors had strong impacts on internet use. Meanwhile, a study in Ethiopia by Yesuf (2021) found  
351 higher internet use among those who were aged 20–24 years, had higher education, lived in  
352 urban areas, had a mobile phone, literate, had a personal computer, and worked in formal sec-  
353 tors. Further, a study by Singh et al. (2020) found that perceived usefulness and social influence  
354 were the key determinants of the use of Fintech services. They also found that age and gender  
355 also influenced this behaviour.

356  
357 The importance of demographic and socioeconomic factors on internet use for health purposes  
358 were also found. Studies by Baumann et al. (2017) and Wang et al. (2019) found age, gender,  
359 and socioeconomic factors were important determinants of online health information-seeking  
360 behaviour.

361  
362 Studies also found the significance of demographic and socioeconomic determinants in internet  
363 use for financial purposes. A study in Russia by Filippova and Turutina (2015) found that age,  
364 gender, financial status, and education level were the determinants of internet use for education

365 purposes. Meanwhile, Sharma et al. (2015) found the importance of demographic variables in  
366 internet use for banking purposes.

367  
368 A study by Burragoni (2017) found that demographic dividend played an important role in 850  
369 million cellular subscriptions in India. In the post-economic liberalization, banking system de-  
370 velopment grew together with the population. Together with economic growth, demand and  
371 challenges in banking and payment system development also grew.

372  
373 Myovella et al. (2021) studied the effects of demographic and economic features on digitaliza-  
374 tion and digital divide in Sub-Saharan African economies. They found that GDP per capita,  
375 gross capital formation, trade openness, population growth, and electricity infrastructure influ-  
376 enced digital divide. Meanwhile, low internet use was found related to low economic, social,  
377 and cultural development. A study in Yaman by Isaac et al. (2018) found that low internet use  
378 was associated with low economic, social, and cultural development. Another study in Indone-  
379 sia also found the importance of access to electricity in internet use (Amaluddin,-2020).

382

383 →

384

385 Mungkin salah satu pertanyaan dan yang menyita banyak perhatian dalam literatur ekonomi  
386 adalah : mengapa sejumlah negara lebih kaya dibandingkan dengan negara lain” (Solow, 1956):  
387 Solow suggested bahwa perbedaan dalam angka pertumbuhan pada akumulasi kapital dapat  
388 mengakibatkan perbedaan dalam output per kapital. Selanjutnya Lucas (1988), disparitas  
389 dalam human capital merupakan central role dalam analisis pertumbuhan dan perkembangan.  
390 Selanjutnya Klenow dan Rodriguez-Clare (1997), Hall and Jones (1999), Parente dan Prescott  
391 (2000) dan kemudian Bils dan Klenow (2000) berargumen bahwa perbedaan output per pekerja  
392 tidak diakibatkan oleh perbedaan dalam human capital (atau physical capital) tetapi oleh  
393 perbedaan dalam sebuah residual yang dinamakan Total Factor Productivity (TFP)

394

395 Total factor productivity (TFP) kemudian merupakan sebuah ukuran produktivitas dihitung  
396 dengan membagi total produksi dengan rata-rata tertimbang dari input, yakni tenaga labor dan  
397 capital. Human capital diperkaya dengan internet dan internet merupakan physical capital yang  
398 sangat berkembang pada revolusi Industri 4.0.

Pertumbuhan internet nampaknya memainkan peran yang lebih penting dalam meningkatkan produktivitas factor hijau di Cina (Li, T., Han, D., Ding, Y., & Shi, Z.,2020). Green Total Factor Productivity merupakan pilihan yang tak terelakkan untuk secara berkesinambungan meningkatkan kualitas ekonomi China, dan juga promote global development. Sejumlah factor seperti Internet development, human capital, urbanization, energy efficiency, and external dependence all exert a positive influence on China's green total factor productivity

Song, Y., & Liu, H. (2020) menunjukkan bahwa internet memperbaiki TFT di sejumlah pelabuhan Sungai Yangtze. Juga ditemukan bahwa pengembangan internet pada area dengan tingkat perkembangan ekonomi yang lebih rendah memperbaiki TFT. Pengembangan internet relevan untuk pembangunan ekonomi.

Zelenyuk, V. (2014) mengembangkan sebuah kerangka kerja menguji dan mendapat signifikansi dari dampak teknologi informasi dan komunikasi pada distribusi produktivitas tenaga kerja pada negara berkembang pada tahun 1980-1995. Internet of Things (IoT) merupakan sebuah innovational complemetary pada ICT dan berimplikasi pada pertumbuhan Total Factor Productivity (Edquist, H., Goodridge, P., & Haskel, J.,2021).

Jika internet merupakan factor pertumbuhan ekonomi, maka studi ini mempelajari factor faktor yang mempengaruhi pertumbuhan dan pemakaian internet.

Figure 2

**Individuals Using the Internet (% of population) by the Demographic Dividend Typology**

Internet can be used as an instrument to develop an economy and to pursue a more developed economy. Adelere and Itasanmi (2016) argued that internet increases the participation and motivates illiteracy alleviation. Internet is also an effective means in adult literacy program. Further, study by Kouton (2019) found that the use of internet reduced energy demand used for heating and transportation. This saving allowed the government to allocate energy generator budget to other sectors.

The use of internet and access to digital devices are continuously increasing in all parts of the world (Horn & Rennie 2018). For example, in Sarawak in Borneo island, Malaysia, a number of remote villages were lack of infrastructure, such as asphalt road and electricity network. But, a number of people had a mobile phone and internet access.

Salahuddin and Alam (2015) studied the association between the internet usage, electricity consumption, and economic growth in Australia. They found that bidirectional causal link

Formatted: Centered

~~between higher electricity consumption was associated with higher electricity consumption~~  
internet usage and economic growth.

Stork et al. (2013) analyzed internet access and use trends in some African countries in 2007/2008 and 2011/2012. They found that the use of internet increased very significantly in these countries despite of some barriers, such as large-scale computers and expensive connectivity costs. In addition, mobile phone had been used as key entry point to internet use. As a result, the internet penetration increased by 11.5% in these countries from 2007/2008 to 2011/2012.

Meanwhile, Nigeria experienced economic growth as an impact of ICT business and telecommunication liberalization during the 2000s (Akinwale et al. 2018). There was a co-integration between ICT and economic growth in the long run. In the short run, only with secure internet server per 1 million and mobile cellular subscription per 100 people resulted in positive and significant impact on economic growth.

Gholizadeh et al. (2014) studied the relationship between gross domestic product (GDP) and internet use in some ASEAN countries during 1996–2011. They found that there was a positive and significant association between internet use and GDP, although there were differences between those ASEAN countries. Meanwhile, a study by Bahrini & Qaffas (2019) in the Middle East and North Africa (MENA) and Sub-saharan Africa (SSA) found that ICT, i.e. mobile phone, internet usage, and broadband adoption were the main driver of economic growth during 2007–2016.

Internet fosters economic growth (Jiménez et al. 2014). An increase of 10% in internet connectivity was found to boost up GDP growth by 1.38% in the world. In OECD countries, high internet access generated GDP by 2%.

Meanwhile, Salahuddin et al. (2016) studied the effects of internet and real GDP on social capital creation measured by trust in Australia during 1985–2013. They found that internet increased social capital in the short run, but reduced social capital in the long run. In addition, there was a short and long run positive relationship between internet and GDP per capita.

478 Not only in developing countries that internet affects economic growth. Amiri & Reif (2013)  
479 in their study in Nordic region found that in countries with highest internet penetration there  
480 was an association between highest internet penetration and highest GDP per capita in the  
481 world.

482  
483 Internet penetration is determined by a number of factors. Feng (2015) studied the factors  
484 influencing internet penetration in China. It was found that internet penetration was mainly  
485 affected by internet access cost, internet content, and GDP per capita.

486  
487 Meanwhile, a study by Lera-López et al. (2011) found that socioeconomic, demographic, and  
488 regional factors influenced internet use. The use of internet was primarily associated with  
489 education, age, occupation, employment in service sector, nationality, living in urban areas,  
490 and regional GDP per capita. They also found that internet use was positively related with  
491 broadband connection and education, while internet skill was influenced by gender and  
492 population size.

493  
494 The relationship between inflation and internet use has also been studied. Yi & Choi (2005)  
495 found that internet improved productivity and reduced inflation. An increase of 1% in the ratio  
496 of the internet users to total population reduced inflation from 0.04264% point to 0.13193%  
497 point. Subsequently, inflation has a positive effect on internet demand.

498  
499 The new economic theory proposed that humankind is entering an era with high output growth,  
500 low unemployment, and low inflation (Meijers, 2006). It is described that inflation suppresses  
501 internet growth and on the other side, internet will increase inflation in the long run. Sharma et  
502 al. (2014) studied the relationship between inflation and internet use through online shopping  
503 in India. They found that inflation had an indirect effect on internet growth.

504  
505 Choi (2003) investigated the effects of internet on the volume of inward foreign direct  
506 investment (FDI). Internet was assumed to boost up higher FDI through productivity  
507 improvement. Using 53 FDI recipient country data and FDI gravity equation it was found that  
508 when the number of hosts and internet users in a country increased by 10%, FDI inflow  
509 increased by more than 2%.

510

511 The international community supports developing countries by building up digital  
512 infrastructure and regulation in order to be able to participate in international trade, in particular  
513 through larger diversification series in export. The study by Gnanngnon (2020) using panel data  
514 from 131 countries during 1995–2014 found that greater internet access was positively  
515 associated with export diversification in particular both in less developed and developed  
516 countries. Internet access creates innovation level of a country, merchandise export including  
517 its concentration export products, and the size of inflow FDI. The results of this study  
518 emphasized the need of digital infrastructure development and regulation that facilitate access  
519 to the internet.

520  
521 Pradhan et al. (2017) also studied the association between FDI, economic growth, and use of  
522 communication technology in 21 Asian countries during 1965–2012. Communication  
523 technology included fixed telephone, mobile phone, and internet use and service including  
524 fixed broadband. The results of the study show that there was a positive association between  
525 FDI, economic growth, and communication technology. Using the Granger causality analysis,  
526 these three variables were positively related.

527  
528 A study on the association between FDI and internet use in 10 ASEAN countries had been  
529 carried out (Ramdan et al. 2020). It was found that higher internet use was associated with  
530 higher FDI. A 1% increase in FDI was associated with a 0.0681 increase in internet use.

Formatted: English (United States)

531  
532  
533 Based on the above literature review, ~~this study aims to investigate the association between~~  
534 ~~demographic and economic factors with internet use in the world.~~ It is hypothesized that higher  
535 internet use is associated with higher demographic dividend typology, higher access to  
536 electricity, higher GDP, lower inflation, and higher FDI.

### 537 538 2.3. Data and Methods

539  
540 This study used data from the World Bank (2021). The unit of analysis was country, covering  
541 186 countries in the world. The study period was from 2001 through 2017. Therefore, there  
542 were 3,162 observations in this study. The countries and study period were selected based on  
543 the availability of data on variables used in the study. In addition, the selected countries were  
544 classified by demographic dividend type by the World Bank (Appendix Table A).

Formatted: Normal, No bullets or numbering

Formatted: Font: Times New Roman, Font color: Black

Formatted: Font: Times New Roman, Font color: Black

545  
546 The dependent variable was the information technology, that is the individuals using the  
547 internet (% of population). The independent variables were the demographic variable and  
548 economic variables. The demographic variable was the type of demographic dividend (TDD)  
549 which was a categorical variable (=0 if pre, =1 if early, =2 if late, and =3 if post). Therefore,  
550 there were three (3) dummy variables for TDD, that is *EarlyDD* (=1 if early, =0 otherwise),  
551 *LateDD* (=1 if late, =0 otherwise), and *PostDD* (=1 if post, =0 otherwise), and pre-demographic  
552 dividend was the reference category. Meanwhile, the economic variables included access to  
553 electricity (% of population, *Electric*), gross domestic product (constant 2010 US\$, *GDP*),  
554 inflation, consumer prices (annual %) (*Inflation*), and foreign direct investment (*FDI*), net  
555 inflows (% of GDP).

Formatted: Normal, No bullets or numbering

Formatted

556  
557 This study employed panel data analyses. The econometric model used was a fixed effects  
558 regression model using income level group, regional group, and year as identifiers. This model  
559 was also carried out based on G20 country group and income level group. The proposed model  
560 in this study was as follows.

Formatted: Font: (Default) Times New Roman

$$561$$
$$562 \quad Internet_{it} = \beta_0 + \beta_{11}EarlyDD_{it} + \beta_{12}LateDD_{it} + \beta_{13}PostDD_{it} + \beta_2Electric_{it}$$
$$563 \quad + \beta_3 \ln(GDP)_{it} + \beta_4 Inflation_{it} + \beta_5 FDI_{it} + \varepsilon$$

Formatted: Font color: Black

Formatted

Formatted: Normal, Indent: Left: 0.25", No bullets or numbering

564  
565 This fixed effects regression model still had endogeneity problem and measurement errors in  
566 the variables used. The demographic dividend type can influence internet use and on the other  
567 hand internet use can affect the demographic dividend type. In addition, the demographic  
568 dividend type is endogenous, that is a variable that is influenced by other variables. Therefore,  
569 other approaches were employed as robustness checks using the static generalized method of  
570 moment (GMM). This GMM is a simultaneous model between an endogenous variable and  
571 instrument or exogenous variables in the first stage regression and an endogenous model  
572 between the dependent variable and independent variables in the second stage regression. The  
573 instrument variables used consisted of crude death rate (deaths per 1,000 people, CDR),  
574 population density (population per km<sup>2</sup>, *Density*), and crude birth rate (births per 1,000 people,  
575 *CBR*).

Formatted

Formatted: Font: (Default) Times New Roman

The endogeneity problem can result in biased and inconsistent estimates when there is lag in dependent variable. This problem can be solved by employing the dynamic panel GMM model. Arellano and Bond (1991) proposed the GMM approach. There are two reasons of applying GMM approach. First, GMM is a common estimator that gives a framework for comparison and evaluation. Second, GMM gives simple alternative to other estimators in particular maximum likelihood.

However, GMM estimators also have some limitations. First, GMM estimator is asymptotically efficient if the sample size is large, but inefficient if the sample size is finite. Second, the estimator sometimes needs a number of programming implementation so that it needs software that can support GMM approach application.

There are three estimation methods that are commonly used in GMM framework, that is first-differences GMM (FD-GMM) or Arellano-Bond GMM (AB-GMM), system GMM (SYS-GMM), and “difference” and “system” GMM dynamic panel estimator. This study employed “difference” and “system” GMM dynamic panel estimator to analyze the estimators. This model was selected because the demographic dividend type was time invariant and the model can solve this problem.

Formatted

This study used data from the World Bank (2021). The unit of analysis was country, covering 186 countries in the world. The study period was from 2001 through 2017. Therefore, there were 3,162 observations in this study. The dependent variable was the information technology, that is the individuals using the internet (% of population). The independent variables were the demographic variable and economic variables. The demographic variable was the typology of demographic dividend that consisted of pre-, early (*EarlyDD*), late (*LateDD*), and post-demographic dividend (*PostDD*) with pre-demographic dividend typology as the reference category. Meanwhile, the economic variables included access to electricity (% of population,

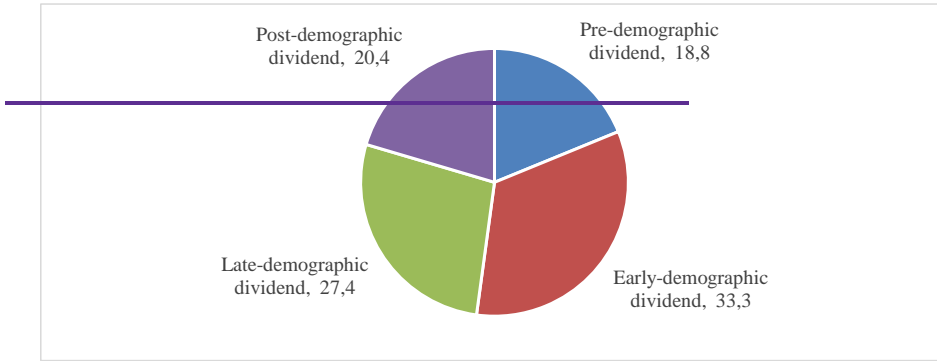

611 *Electric*), gross domestic product (constant 2010 US\$, *GDP*), inflation, consumer prices  
612 (annual %) (*Inflation*), and foreign direct investment (*FDI*, net inflows (% of GDP).

613  
614 Data in this study were analyzed using univariate, bivariate, and multivariate analyses. For the  
615 univariate analysis, the percentage distribution of countries by the demographic dividend  
616 typology and the summary statistics (the number of observations, the mean, standard deviation,  
617 minimum, and maximum) of the continuous variables in the model were given. For the  
618 bivariate analysis, the average percentage of individuals using the internet by the demographic  
619 dividend typology and simple regression analyses between the internet use and economic  
620 variables were performed. For the multivariate analysis, a multiple regression with random  
621 effects was carried out to investigate the demographic and economic determinants of internet  
622 use in countries in the world during 2001–2017. The model was as follows.

$$623 \quad \text{Internet} = \beta_0 + \beta_{11}\text{EarlyDD} + \beta_{12}\text{LateDD} + \beta_{13}\text{PostDD} + \beta_2\text{Electric} + \beta_3\ln(\text{GDP}) \\ 624 \quad \quad \quad + \beta_4\text{Inflation} + \beta_5\text{FDI} + \epsilon$$

#### 627 **3.4. Results**

628 The results of univariate analysis are presented in Figure 3 and Table 1. It can be seen from  
629 Figure 3 that the majority of countries in the world were in early demographic dividend  
630 typology (33.3%), followed by in late demographic dividend typology (27.4%), in post-  
631 demographic dividend typology (20.4%), and in pre demographic dividend typology (18.8%).  
632 Meanwhile, it can be seen from Table 1, the percentage of individuals using the internet ranged  
633 from none in Timor Leste in 2001 to almost universal of 98.3% in Iceland in 2017 and the  
634 percentage of population with access to electricity varied from a low of 0.53% in Liberia in  
635 2001 to universal, 100%, in Iceland in 2017. Further, the GDP constant ranged between  
636 US\$143.2 thousand in Kiribati in 2001 and US\$17.4 trillion in the United States in 2017, the  
637 annual inflation (consumer prices) varied from a low of -18.1% in Bhutan in 2004 to a high of  
638 359.9% in the Democratic Republic of Congo in 2001, and the current net inflows foreign  
639 direct investment differed from -58.2% in Luxembourg in 2007 to 56.5% in Malta in 2007.

**Table 1**

**Summary Statistics of Variables in the Model: Number of Observation, Mean, Standard Deviation, Minimum, and Maximum**

Variable	Observation	Mean	Standard Deviation	Minimum	Maximum
Individuals using the Internet (% of population)	3,162	30.5	28.3	0.0	98.3
Access to electricity (% of population)	3,162	78.3	30.6	0.53	100.00
GDP (constant 2010 US\$)	3,162	347.0 billion	1,334.6 billion	143.2 thousand	17.4 trillion
Inflation, consumer prices (annual %)	3,162	6.0	11.3	-18.1	359.9
Foreign direct investment, net inflows (% of GDP)	3,162	6.2	18.0	-58.2	56.5

Source: World Bank (2021) (Author's compilation).

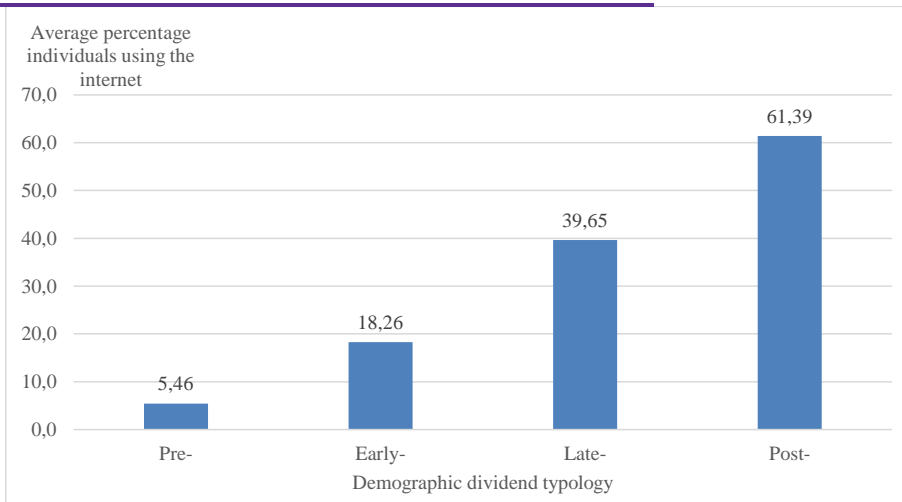

The results of bivariate analysis are displayed in Figure 4–Figure 8. These are the average percentage of individuals using the internet by the demographic dividend typology (Figure 4) and the scatter diagrams, simple regression equations and lines, and coefficient determinations between each independent variable in the model and the dependent variable (Figure 5–8). It can be seen from Figure 4 that the average percentage of individuals using the internet was

657 lowest in pre-demographic dividend typology countries (5.5%) and highest in post-  
658 demographic dividend typology countries (61.5%).

659  
660 Figure 5 shows that there was a positive relationship between access to electricity and internet  
661 use. An increase of one percent in population with electricity was related with an increase of  
662 about 0.56% in the individuals using the internet. The coefficient of determination was 0.366  
663 indicating that 37% of the variation in the individuals using the internet can be explained by  
664 the variation in the access to electricity.

665  
666 Figure 6 shows that there was a positive relationship between  $\ln(\text{GDP})$  and internet use. An  
667 increase of one percent in economic growth (GDP constant 2010) was correlated with an  
668 increase of about 0.35% in the individuals using the internet. The coefficient of determination  
669 was 0.0008 suggesting that  $\ln(\text{GDP})$  can explain the variation in the individuals using the  
670 internet by 0.08%.

Figure 6

ln(GDP constant) and Individuals using the internet (% of population): World 2001–2017

687 Figure 7 indicates that there was a negative relationship between inflation and internet use. An  
688 increase of one percent in inflation was related with a decline of about 0.43% in the individuals  
689 using the internet. The coefficient of determination was 0.029 indicating that 2.9% of the  
690 variation in the individuals using the internet can be explained by the variation in inflation.  
691

697 **World 2001–2017**

698  
699 Figure 8 shows that there was a positive relationship between FDI and internet use. An increase  
700 of one percent in FDI was correlated with an increase of about 0.009 in the individuals using  
701 the internet. The coefficient of determination was 0.009 suggesting that the variation in FDI  
702 can explain the variation in the individuals using the internet by 0.9%.

**Figure 8**

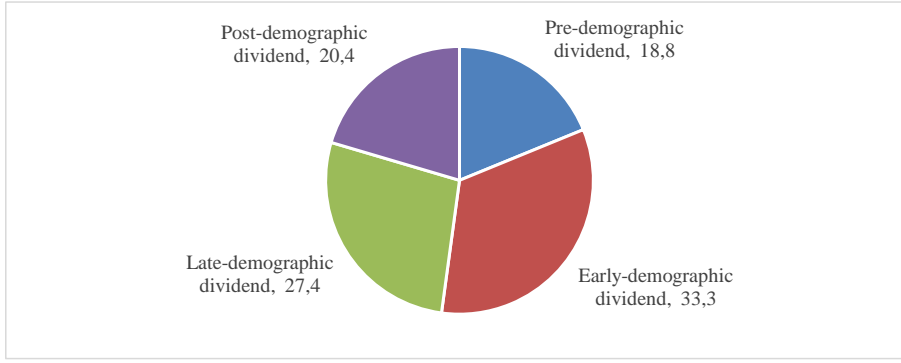

706

**Foreign direct investment (net inflows, % of GDP) and Individuals using the internet (% of population): World 2001–2017**

707

708 It can be seen from Figure 1 the majority of countries in the world were in early-demographic  
 709 dividend type (33.3%), followed by in late-demographic dividend type (27.4%), in post-  
 710 demographic dividend type (20.4%), and in pre-demographic dividend type (18.8%). The  
 711 majority of countries in early-demographic dividend type were African countries, such as  
 712 Angola, Benin, Chad, Eritrea, Kenya, Niger, Sudan, Togo, Uganda, and Zambia (Appendix  
 713 Table A). Meanwhile, most developed countries were in post-demographic dividend countries,  
 714 such as Australia, Belgium, Canada, Denmark, Germany, Japan, Norway, Singapore, United  
 715 Kingdom, and United States.

**Figure 1**

**Percentage distribution of countries by demographic dividend typology (%):  
World 2001–2017**

The number of observation and mean of variables used in the study both for full observations and by demographic dividend type was presented in Table 1. It can be seen that there was a significant variation in internet use across countries in the world and across demographic dividend types. The mean of individuals using the internet was 30.5% for full observations, lowest in pre-demographic dividend countries (only 5.5%), 18.3% in early-demographic dividend countries, 39.7% in late-demographic dividend countries, and highest in post-demographic dividend countries (61.4%). Other variables also show disparities in demographic and economic features across countries and demographic dividend types that reflects better development achievement in more developed countries.

Table 1. Number of observations (*n*) and mean of variables in the study for full observation and by demographic dividend type.

Variable	Full Observation		Pre-Demographic Dividend		Early-Demographic Dividend		Late-Demographic Dividend		Post-Demographic Dividend	
	<i>n</i>	Mean	<i>n</i>	Mean	<i>n</i>	Mean	<i>n</i>	Mean	<i>n</i>	Mean

The results of diagnostic tests show that the residual approached normal distribution but statistically not normal (Jarque-Bera normality test was 52.24 and  $\chi^2 = 4.5E-12$ ). But, this assumption only applies for certain models. This assumption is not used if random effects regression, GMM, instrumental variables, and two-stage least squares (2SLS) are used.

The results of multicollinearity test show that there was no variance inflation factor (VIF) that was greater than 10. The mean of VIF was 2.650. In addition, there was no pairwise correlations that was greater than 0.5. It means there was no multicollinearity indication in the model.

There was heteroscedasticity in the model.  $\chi^2 = 1,726.32$  and  $\text{Prob} > \chi^2 = 0.000$ . This problem was solved by using STATA application by making the model that improved standard errors (robust standard errors).

The results of Chow test show that fixed effects model was better than pooled least squares model ( $F(3, 3151) = 181.13$ ,  $\text{Prob} > F = 0.000$ ). In addition, the results of Hausman test show that fixed effects model was better than random effects model ( $\chi^2 = 817.94$  and  $\text{Prob} > \chi^2 = 0.000$ ). Further, the results of Breusch and Pagan Lagrangian multiplier test show that random effects model was better than pooled least squares model.

The results of fixed effect regression using income level group, regional group, and year as identifiers show that in general demographic dividend had significant positive association with internet use (Table 2). After controlling for the economic features, the percentage of individuals using the internet was, respectively 6.5%–21% higher and 15%–39% higher in late-demographic dividend and post-demographic dividend countries than in pre-demographic dividend countries. This finding supported the results of a study by Lera-López et al. (2011) and Myovella et al. (2021) that found the role of demographic factor in increasing internet use in the world. More favorable demographic features, including being a late- and post-

demographic dividend country, had been an important factor of better development that could enhance access to information and communication technology including internet use.

Table 2 Results of Fixed Effects Regression based on Identifier.

Covariates	Identifier		
	Income level group	Regional group	Year
Early-Demographic Dividend	0.317 (1.221)	1.398 (1.425)	4.409*** (0.921)
Late-Demographic Dividend	6.507*** (1.542)	14.398*** (1.749)	21.101*** (1.588)
Post-Demographic Dividend	15.142*** (1.721)	30.349*** (1.939)	39.005*** (0.691)
Access to electricity (% of population)	0.216*** (0.021)	0.290*** (0.022)	0.161*** (0.035)
Inflation, consumer prices (annual %)	-0.115*** (0.028)	-0.176*** (0.030)	-0.070 (0.051)
log(gdpconstant2010us)	1.650*** (0.166)	1.958*** (0.183)	1.666*** (0.059)

Source: World Bank (2021) (Author's compilation).

Before a multiple regression was conducted, the multi-collinearity between the variables in the model were checked. It was found that there was no collinearity between variables in the model, except between the demographic dividend typology and electricity where the Spearman correlation coefficient was slightly above 0.7 (0.71). However, this did not have serious effects on the results of the regression. The results of the multiple fixed effects regression are given in Table 2. These include the regression coefficient, standard errors, and p value for each covariate. All covariates in the model had significant effects on internet use statistically. The coefficient of variation was 0.540 implying that 54.0% of the variation in the internet use could be explained by the model with a significance level below 0.001.

780  
781 The demographic dividend typology was positively associated with the internet use. Late and  
782 post demographic dividend countries had higher percentage of individuals using the internet  
783 than pre demographic dividend countries. After controlling for the effects of economic factors,  
784 the percentage of individuals using the internet was, respectively, 13.0% and 29.7% higher in  
785 the late and post demographic dividend countries than in the pre demographic dividend  
786 countries. This result supports the finding by Lera López et al. (2011) on the importance of  
787 demographic factors on internet use. Countries with more advanced demographic change, that  
788 is late and post demographic dividend typology had lower fertility levels and better economic  
789 development achievement so that individuals in these countries were more likely to have  
790 exposed to better development, including access internet than individuals in pre and early  
791 demographic dividend typology countries.

792  
793 Access to electricity was the strongest factor that affected-influenced internet use positively.  
794 The higher the percentage of population who had access to electricity, the higher the percentage  
795 of individuals using the internet. Other things being the same, an increase of one percent in the  
796 access to electricity was related to an increase of 0.27% - 0.161% - 0.290% in the internet use.  
797 This finding is in accordance with the finding by Myovella et al. (2021) Salahuddin and Alam  
798 (2015) that found the positive association between internet use and electricity consumption and  
799 internet use. Access to electricity can boost the electricity-based economic activity and in  
800 today's industrial internet of things era, it is a key factor of internet use since the internet cannot  
801 be used without electricity.

802  
803 Economic growth was had the second strongest factor of and had a positive effect on the  
804 internet use. The higher the economic growth, the higher the percentage of internet use. Ceteris  
805 paribus, an increase of one percent in economic growth was associated with an increase of  
806 internet use by 4.61.650% - 1.958%. This result supports the study result by Pradhan et al.  
807 (2017) and Amaluddin (2020) that found a positive relationship between economic growth and  
808 internet use. Economic growth allows a country to expand its economy that today heavily  
809 depends on the internet and hence increases internet use.

810  
811 Inflation had a negative relationship with the percentage of individuals using the internet. The  
812 higher the inflation in a demographic dividend typology, the lower the percentage of  
813 individuals using the internet. After controlling for the effects of other factors, an increase of

814 one percent in inflation was associated with a decline of the percentage of individuals using  
815 the internet by 0.1~~8~~15% – 0.176%. This finding confirms the results of study by Yi & Choi  
816 (2005) that found a negative association between inflation and internet use. This is because  
817 inflation is a contributor of cost and price rise including internet cost that reduces internet use  
818 through the decline in people’s purchasing power including purchasing the internet because of  
819 the price rise across the economies.

820  
821  
822 Foreign direct investment (FDI) had a positive influence on internet use. The higher the FDI,  
823 the higher the internet use. An increase of one percent in FDI was related with an increase of  
824 the percentage of individuals using the internet by 0.04~~85~~%–0.052%. This results strengthens  
825 the study finding by Gnanon (2020) and Ramdan et al. (2020) that found a positive  
826 relationship between FDI and internet use through the capital ~~addition~~–accumulation in an  
827 economy that can increase individuals’ access to the internet use.

828  
829 The results of the above analyses also show that 16.5%–65.6% of variation in internet use was  
830 explained by demographic dividend type and economic features.

831  
832 The above results still had heteroscedasticity and endogeneity effects problem. To obtain  
833 consistent and robust results, this study conducted robustness checks by employing other  
834 approaches and different sub-samples. The results were as follows.

835  
836 This study presented the results of analyses employing fixed effects, random effects, and  
837 pooled least square model. The results of the three models gave consistent results that  
838 demographic dividend type had positive effects on internet use significantly. The percentage  
839 of individuals using internet was 13%–14% and around 30% higher in, respectively, late- and  
840 post-demographic dividend countries than in pre-demographic dividend countries (Table 3). In  
841 addition, higher percentage of individuals using internet was associated with higher percentage  
842 of access to electricity, economic growth, and FDI and associated with lower inflation. A one  
843 percent increase in, respectively, access to electricity, economic growth, FDI, and inflation was  
844 associated with, respectively, an increase of about 0.3%, 2%, and 0.05% individuals using  
845 internet and a decline of 0.2% individuals using internet.

846

849  
 850 In Table 4, the results of analyses of fixed effects regressions for full observation and by income  
 851 group were presented. It can be seen that the results were consistent with the previous results  
 852 of the positive association between demographic dividend type, electricity, economic growth,  
 853 and FDI with internet use and negative association between inflation and internet use. In  
 854 addition, the effect of demographic dividend was largest in upper middle income countries and  
 855 insignificant in high income countries.

In Table 5, the results of analyses of fixed effects regression for full observation and by year were presented. It can be seen that the results were also consistent with the previous results of the positive association between demographic dividend type, electricity, economic growth, and FDI with internet use and negative association between inflation and internet use. In addition, the percentage of individuals using internet was significantly higher in early-demographic dividend countries than in pre-demographic dividend countries in 2007–2012 and in 2013–2017 with an increasing effect.

868  
869 The 2SLS model used CDR, population density, and CBR as instrumental variables. The results  
870 of diagnostic test for instrumental variable in 2SLS and GMM model show that  $F(1, 3154) =$   
871 69.68, which was greater than 10, and  $Prob > F = 0.0000$ , meaning that the models had strong  
872 instrumental variables. In addition, the results for first stage regression show that Sanderson-  
873 Windmeijer (SW) first-stage chi-squared and F statistic was significant, meaning that all  
874 instrument variables were relevant or valid to explain the endogeneous variable (demographic  
875 dividend type). The results of the first stage regression of 2SLS model were presented in Table  
876 6.

878  
879 The results of second stage regression for full observations and based on income group were  
880 given in Table 7. It can be seen that the 2SLS method results for full observations were also  
881 consistent with the previous results. The percentage individuals using the internet was  
882 significantly higher in early-, late-, and post-demographic dividend countries than in pre-  
883 demographic dividend countries, but with much higher percentages than in the previous  
884 models. In addition, the percentage individuals using the internet was also significantly higher  
885 in countries with lower inflation and higher economic growth and FDI. By income group,  
886 demographic dividend type had significant positive effects on internet use in low and high  
887 income countries.

In this study, the comparison between the results of fixed-effects regression and 2SLS method based on G20 and non-G20 group was also carried out. The results were presented in Table 8. It can be seen that the results were consistent with the previous results that demographic dividend type had significant positive influence on internet use both in non-G20 and G20 countries.

**Table 8. The Results of Second Stage Regression based on G20 Country Group.**

The 2SLS method by year was also done. The results were presented in Table 9. It can be seen that the results were also consistent with the previous results that demographic dividend type had significant positive influence on internet use in all years. In addition, the percentage individuals using the internet was also significantly higher in countries with lower inflation and higher economic growth and FDI in all years.

Table 9. The Results of Second Stage Regression by Year.

#### 4.5. Conclusions

In this study the nexus between demographic and economic features with internet use in countries during 2001–2017 was investigated. A fixed effects regression model using income level group, regional group, and year as identifiers was employed to study the association between the type of demographic dividend, access to electricity, gross domestic product, inflation, and foreign direct investment and internet use. Robustness checks were also carried out using the static generalized method of moment between the type of demographic dividend and instrument variables (crude death rate, population density, and crude birth rate) in the first stage regression and between the type of demographic dividend, access to electricity, gross domestic product, inflation, and foreign direct investment and internet use in the second stage regression.

The results of this study confirms the previous studies on the nexus between demographic and economic features with internet use (e.g. Filippova and Turutina (2015); Sharma et al. (2015); Baumann et al. (2017); Pradhan et al. (2017); Scheerder et al. (2017); Wang et al. (2019); Singh et al. (2020); Bianchini et al. (2021); Myovella et al. (2021); Yesuf (2021)). It was found that internet use was higher in countries from late- and post-demographic dividend type. Meanwhile, access to electricity, economic growth, and foreign direct investment had a positive association with internet use and inflation was negatively associated with internet use.

Therefore, it is recommended that in order to boost up internet use, which is essential for better development achievement, government of countries, in particular countries in the pre- and early-demographic dividend type, should manage its demographic features to the more favorable ones, i.e. lower fertility and mortality. In addition, the window of opportunity due to the decline of fertility and mortality should be capitalized in order to reap the demographic dividend of economic growth and family welfare acceleration by improving access to quality health, education, and employment opportunity. Regarding economic features, in order to

### 944 **Limitations**

945 A limitation of this study is that the demographic dividend type was a time invariant variable,  
946 while other variables were time variant. However, this limitation should not significantly affect  
947 the findings and this study still provides an essential contribution to the study of internet usage.  
948 So, it is suggested that further research on the determinants of internet usage should employ  
949 time variant demographic change variable.

950 5. The results of this study confirms the previous studies on the nexus between  
951 demographic change and economic features with internet use. Countries from post  
952 demographic dividend typology with better access to electricity, higher economic growth,  
953 lower inflation, and higher foreign direct investment had higher internet use. Therefore, it is  
954 recommended that in order to boost up internet use, which is essential for better development  
955 achievement, government of countries should manage its demographic change, increase access  
956 to electricity, improve economic growth, reduce inflation, and enhance foreign direct  
957 investment.
